STRONG GRIPPING POWER

One of the characteristic features of Dick's Belting is the strong gripping power, which ensures the transmission, positively without loss, of the whole power given off by the engine. The entire absence of stretching or slipping is another important quality Dick's Belts possess. It will pay you to investigate these belts before buying any other make.

Get a copy of Catalog No. 17.

Plain Red Oak

Biggest
Door
Success
of the
Season

$\frac{3}{4}$ in. Panel
Heavy Rails
Bolection Moulded
Bench Finished

Our Announcement of the MIDLAND SPECIAL Low-Priced, High-Grade Veneered Doors has met with INSTANTANEOUS SUCCESS,, and we have already booked orders for some of the largest Apartment and Hotel jobs, as well as a host of smaller orders.

It's a Good Door, Honestly-built, Made in Canada,—and it's a Big Success.

Send for booklet, *The Midland Special*, with prices and Discounts.

This is the only Canadian made Veneered Door that competes successfully with American Stock Lines.

Get the Best—It's made in Canada.

Georgian Bay Shook Mills, Ltd.

Midland, - Ontario

Manufacturers from the Tree to the Finished Product.

View of our Mill and Booms

Red and White Pine

A choice lot of red and white pine logs are on the way down the Sturgeon River for us. With our mills always running this supply of logs will soon be manufactured into first-class lumber. We have recently added to our facilities, by purchasing the Nipissing Mill. We are prepared to undertake any kind of dressing on short notice.

Orders carefully and promptly handled.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |
| | POWER PLANT |
| | 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| | 2 Double Duplex, high pressure Water Pumps. |
| | 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| | 2 125 h.p. Water Wheels. |
| | 1 Upright Engine for sawdust conveyor. |
| | 1 10 h.p. Engine. |
| | 1 Mitts & Merrell Hog. |
| | 1 Wood Machine for 22-in. wood. |
| | 1 Wood Machine for 16-in. wood. |
| | 1 Edger for ripping dry lumber, installed. |
| | 1 Edger for ripping dry lumber, not installed. |
| | 1 30 h.p. Generator, 250 volt. |
| | 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- 1 Automatic Filing Machine for 12-in. D.C. band saws.
- 1 Automatic Grinding Machine for 8-in. S.C. band saws.

A. H. Johnson, Wholesale Druggist, Collingwood, Ont.

Good Lumber HORSES

Should be free from all blemishes

Use

ABSORBINE

for Wind Puff,
Capped Elbow,
Bog Spavin,
Thoroughpin,
Shoe Boil,
Curb, Enlarged
Glands and all
puffs and swell-
ings, Fistula,
Poll Evip,
Sprains, Con-
tracted Ten-
dons, Bruises,
Lameness of
all kinds.

ANTISEPTIC

You cannot get good work out of your lumber horses if they are lame, blemished, sore, sick or similarly unfit.

The animal with Swellings, Soft Bunches, Bog Spavins or any such blemish, whether lame or not, needs your attention.

ABSORBINE

is your own and your horse's best friend—it relieves the horse of all pain, soreness and troublesome blemish. It makes the horse better looking, better working, more fit and of greater value to you.

You can work your horse at the same time. This is no new lotion but the tried and tested remedy of many years successful use.

Thousands upon thousands of horses which would have been ailing and sick and unsightly have been made fit and well—good workers and good lookers. What others have done with Absorbine you can do, too.

All enquiries on special cases answered without delay—full information and instruction on request.

Absorbine \$2.00 a bottle at druggists or delivered.

Manufactured only by

ABSORBINE

does not blister or remove the hair, never leaves scars or blemishes of any kind.

It is easy to apply and does not require the horse to be laid up.

Highly concentrated and only a few drops required at each application.

Spartan Belting—A Belt for Hard Drives—

in saw mills, planing mills and all woodworking plants where the maximum of power transmission is always demanded.

Spartan Belting

is made from a special tannage of leather—it is constructed particularly for hard service—high speed drives—small pulleys—its unusual flexibility insures instantaneous grip—maximum efficiency and greater economy.

The hardest drives have no terrors for Spartan Belting—they all tend strictly to business just as soon as Spartan gets on the job. Our Spartan Booklet contains convincing "Reasons Why" every belt user needs a copy.

BATHURST, NEW BRUNSWICK

Try pulling this Belt apart

That will give you some idea of the enormous strength built into Goodyear Belts. Not an ounce of untested rubber is used, not a roll of untested duck. Each finished Belt is inspected before shipping *to make sure* that it will stand the *wear* and keep *pliable*.

The Goodyear system of Belt making is calculated to give the greatest efficiency in practical Belt Service.

A close, clinging grip of the pulleys—absolutely non-slipping. Goodyear Rubber Belting gives this cohesive contact because of its yielding rubber surface, and the practical result is an immense saving of power.

Pliability under all conditions. A belt must be pliable to grip the pulleys. The hard cotton fibre of Goodyear Belting is permeated—under tremendous pressure—with rubber. The treated layers are compressed into an homogeneous mass. This preserves the pliability of rubber in the finished Belt.

Entire absence of "stretch." The "curing" or vulcanizing of Goodyear Belting is performed whilst the Belt is stretched to the limit of safety in a special machine. "Stretch" in service therefore is impossible. This means no stopping of machines for adjustment—no idle machines, no idle men.

Enormous strength. The union of carefully tested hard-fibre cotton with tenacious and elastic rubber "friction"—compressed to make the plies practically inseparable—gives a combination of prodigious strength. A Goodyear Rubber Belt is as nearly unbreakable as any Belt can be.

Long Life. The duck or fabric of Goodyear Belting cannot be reached by water, or anything else that would set up rot and destroy the Belt. A Goodyear Belt renders long and efficient service.

Griplock Riveted Chain Belt

Section of Griplock Riveted

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock**. **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis.; a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 13

Trade Conditions—What Are They?

More lumbermen are talking to-day about trade conditions than usual. There is no serious significance about this, but there is an important significance nevertheless. Go into any lumberman's office to-day and the chances are ten to one that before long one of you will say something leading to a lengthy discussion of trade conditions. It is an easy gamble also, that, during the discussion, there will be something about crops, real estate, steel, freight rates, tariff, the high cost of labor, tight money, and other economic factors, to say nothing of our old friends "demand and supply." The fact of the matter is that the lumberman is becoming more and more a keenly analytical student of economic conditions. "Demand and supply" don't satisfy him like they used to. He wants to know what make them up, and he gets down to steel and freight rates, wages and real estate, tariff and tight money. And when he has got at a few of the essential facts in connection with these matters he has gone a long way towards acquiring a useful understanding of business conditions.

An example in brief form of the wide vision of the lumberman of to-day is afforded by the market letters issued by some of the larger wholesale firms in the United States. Here are a few important quotations from one of them which go to illustrate the point:—

"If lumber merchants keep continually advised of conditions in the steel trade, they may be better equipped to arrive at reasonable conclusions in the lumber industry. During the past month, unfilled orders for steel have been reduced 654,000 tons. It is problematical, whether this fact is temporary, due to proposed tariff changes, or whether it reflects a change of tendency in the steel trade. If the latter, then other kindred industries may be expected to experience

similar conditions. Our opinion is, however, that the absence of orders is temporary.

"Some prone to pessimism regard the recent decision from the Supreme Court in the Minnesota Rate Case, as detrimental to railroads and other corporations, and think that the roads will decrease their volume of buying in consequence. We cannot agree with such opinions, as the decision makes the Interstate Commerce Commission a servant of Congress, which is the final authority in making and regulating railroad rates, which authority will be ultimately welcomed by all corporate bodies at interest. The vision of many has been obscured in their interpretations of this decision, and we venture to predict that railroads will soon become active buyers.

"The assurance on the part of Secretary McAdoo, that he will authorize emergency currency, in the sum of \$500,000,000, in the event of need, is certainly an argument against tight money.

"To date, crop reports are exceptionally favorable."

The above facts have a direct bearing upon the probable course of lumber trade conditions and are an interesting evidence of the lumberman's wide field of vision.

Trying to Reduce Overweight Troubles

At the recent annual meeting of the National Hardwood Lumber Association an interesting report was presented by the committee on "overweight claims." They stated that substantial progress had been made during the past year along the line of establishing an accurate basis for the weighing of car load shipments of lumber by the railroads. The evidence brought out had shown that the weighing of cars had been grossly and irregularly handled. It was shown that the inspection bureaus were not inspecting the scales regularly and in some cases had no record that certain scales had ever been tested. It also developed that they were weighing cars while moving across the scales without being uncoupled, and that they were weighing cars on scales that were not long enough to hold the entire car. They would weigh one end of the car at a time and then divide the weights.

A conference was held on April 26th at which practically all the railroads of the United States were represented and a number of the large shipping interests. A petition had been filed with the Interstate Commerce Commission and evidence had been taken at practically every large shipping point. The attorney for the Commission recommended, at the conference, that the Commission should supervise the weighing of car load shipments in future, so far as the character of the scales used was concerned, together with the methods of weighing cars. He suggested also that the Commission should have the railroads put in scales of sufficient size so that both trucks of all sized cars could be put on the scale at one time; also, that the railroads be instructed to construct gravity yards so that the cars could be cut off at a hump and allowed to travel across the scale at a speed which would enable them to be weighed properly, instead of taking them across the scales at a speed that, as some have put it, "it was impossible to get the number correctly, let alone the weight of the car."

From this it is believed that the Commission will supervise the weighing of all car load shipments in the manner suggested and supervise the inspection of scales. Apparently the Commission intends to discourage the use of estimated weights, except in extreme cases. The adoption of this principle will go a long way towards eliminating one of the most trying difficulties connected with lumber shipments.

Profit in Wood-Waste

The utilization of wood waste in a more thorough manner, has become one of the most interesting and important features of the lumbering industry and those industries with which it is allied, of late years, than formerly. For many years, those who were engaged in sawmilling or logging, referred to the waste in the woods and at the mills as something regrettable or unavoidable. It was customary to remark that there was a fortune awaiting some man who would invent a means of utilizing profitably, the slabs, edgings, sawdust, etc., which

were destroyed at the mills. No one has invented a secret method, but it has been gradually learned by keen students and business men that there is money in these materials and that it pays to extract it. Unquestionably we shall see before long a far more general conversion of these materials into valuable products.

The most interesting fact connected with this situation is that the change is not confined to one direction. It is not an "invention" so to speak. It is the property of anyone who cares to study the question energetically. An increasing variety of uses is being found, to which the so-called "wood-waste" can be put. Beginning in the forest the closer utilization of the various wood-products can be traced through the saw mills and large wood-working industries, right down to the firms working only on small specialized lines.

It is now commercially possible to reduce the fifty to sixty per cent. waste formerly left in the woods by the lumberman to no more than five per cent., by a combination of three well-developed chemical industries, namely, paper making, wood distillation (in a modified form) and the manufacture of resin oils. Practically all the valuable constituents from the stumps, tops, branches and defective stems which would otherwise be left to rot in the forest are thus converted into useful commodities.

The utilization of mill waste is being made increasingly possible by the developing markets for odd and short lengths in lumber instead

of a few assorted sizes. Many saw mills use their waste products in the manufacture of laths, mouldings, pickets, roller blinds and paving blocks. The manufacture of wood pulp from the small waste wood now being fed to the burner is also a commercial possibility. Even sawdust has its uses, and in countries where more intensive utilization prevails it is being successfully manufactured into a variety of products. Several plants have been erected in this country for its manufacture into ethyl (or grain) alcohol, sugar and briquets for fuel.

A bulletin being issued by the Forestry Branch, Ottawa, on The Wood-Using Industries of Ontario, of which an advanced summary appeared recently in the Canada Lumberman, throws considerable light on the utilization of wood-waste. Sash and door factories sell or use their short ends and trimmings for the manufacture of boxes, baskets, bobbins, butter moulds, insulator pins, novelties, skewers, spindles, spools, stakes and wooden ware. They bale their common sawdust and sell it for floor covering for the manufacture of composition novelties, and for cleaning screws. They sell shavings for bedding, packing and for drying wet land. Hickory and other hardwood dust is sold for smoking meats. In fact, just as the pork packers boast of using all a pig but the "spueal," so wood manufacturers will soon be able to boast of using all the wood but the bark—and even that, in the case of some woods, such as hemlock, is of considerable value.

Crop Conditions Favorable

During the balance of the summer and fall of the present year, more interest will be taken in the crop reports published by the governments and railroads, than in any other factor in the business situation. As stated in the Canada Lumberman for June 15th, the present business situation is at a turning point, waiting for adverse or favorable conditions to settle its future course. The crops are likely to be one of the most important of these conditions, as the regulate for a time, the price of money, and at a little later date furnish the farmers with money to spend on manufactured articles.

The Census and Statistics Office issued, on June 13th, preliminary estimates of the areas sown to the principal grain crops and reports on their condition at the end of May, according to the returns received from crop-reporting correspondents throughout Canada. The reports show that the month of May proved cold and dry with frequent night frosts and that these conditions, whilst favorable to seeding, retarded the growth of the crops sown and caused them to be unseasonably backward.

The total area under wheat in Canada is provisionally estimated at 9,816,300 acres, or 57,900 acres more than in 1912, the area in spring wheat being 8,990,500 acres, or 13,100 acres more. Oats occupy 9,608,500 acres compared with 9,216,000 acres in 1912, an increase of 391,600

acres, barley occupies 1,425,200 acres, an increase of 10,000 acres, and rye 126,500 acres, a decrease of 9,610 acres. For wheat, barley and oats taken together the increase represents 459,500 acres. The estimated acreage under hay and clover is 7,475,600 acres, compared with 7,633,600 acres last year.

For the three north-west provinces of Manitoba, Saskatchewan and Alberta the total wheat area is estimated at 9,013,800 acres, as compared with 8,961,800 acres, that of oats at 5,207,700 acres, compared with 4,913,900 acres, and that of barley at 852,600 acres, compared with 809,800 acres, these differences representing increases of 52,000 acres for wheat, 293,800 acres for oats and 42,800 acres for barley, or 388,600 acres for the three crops.

On May 31st the condition of the crops was reported as generally favorable throughout Canada. Expressed in percentage of the usual standard of 100, taken as representing the promise of a full crop, the condition, on May 31st for the Dominion was as follows: Fall wheat, 80.62; spring wheat, 91.55; oats, 91.72; barley, 91.19; rye, 87.70; peas, 88.24; mixed grains, 90.15; hay and clover, 81.12; pastures, 85.08, and alfalfa, 77. At the corresponding date last year the condition of fall wheat was only 71.46. All the other crops were then above 90, excepting rye, 87.24; pears, 83.85, and mixed grains 87.72.

Pulpwood Exports to U. S. Increase

A total of 1,846,910 cords of pulpwood were cut in Canada during 1912, an increase of twenty-one and one-half (21.5) per cent. over the total cut of 1911. Of this large cut over one-half was exported to the United States, the remainder being manufactured into pulp by the forty-eight mills operating in Canada. These are the figures given out by the Dominion Forestry Branch, Ottawa.

This increase in quantity of raw material exported in 1912 over the amount exported in 1911 was probably due to the decline in price of pulpwood in the local market, the average price paid by Canadian firms being six dollars per cord, whereas foreign firms paid an average price of six dollars and eighty-two cents (\$6.82) per cord for the pulpwood exported. This exported wood, had it been worked up in Canada, would have been sufficient to supply fifty-four pulp mills of the average size operating in the country at present. It would have produced 773,136 tons of pulp, which, at the average export price of \$17.10 per ton, as compared with the price of \$6.82 paid for the unmanufactured pulpwood, represents a net loss to the country of over six and one-half million dollars.

Statistics show that spruce still constitutes over seventy-five per

cent. of the pulpwood cut, but there has been an increasing use of balsam fir in the eastern provinces and western hemlock in British Columbia with very satisfactory results in each case. When the sulphate process, recently brought into use in Canada, comes into wider use, there will be a decided increase in the amount of fir and hemlock used for pulp. This process, which is used at present by three mills in Quebec, yields excellent pulp for the manufacture of finer grades of paper and for wrapping. The solution used for dissolving the chipped wood into pulp, consists of seventy-five per cent. sodium sulphate (salt-cake), and twenty-five per cent of lime. No acids are used, giving economy of maintenance, and almost all kinds of wood are adaptable to the process, which is, in this way especially, superior to soda and sulphite methods.

In the House of Commons recently, Hon. T. W. Crothers, acting Minister of the Interior, introduced a bill which increased the area of Canadian forest reserves from 25,042 square miles to 35,802 square miles. Of this increase 667 square miles were in British Columbia, 7,707 in Alberta, 865 in Saskatchewan and 524 in Manitoba.

Railway Commission Hears Reciprocal Demurrage Case

The Dominion Board of Railway Commissioners heard evidence and argument on June 16th and 17th in connection with the application of shippers for reciprocal and average demurrage. Mr. M. K. Cowan, K. C., on behalf of the shippers, argued that what was sauce for the goose was sauce for the gander. A system which would fine railways, as well as the shippers, for delay in unloading the cars, was entirely justifiable. Mr. J. E. Walsh, traffic expert for the Canadian Manufacturers' Association, stated that shippers would be willing to let the penalties imposed upon the railways go to the Crown if desired, if only they would have the desired effect of improving the car service. Reciprocal demurrage had justified itself in the United States and had demonstrated that the railways rather than the shippers, were responsible for delays.

Mr. T. G. Marshall, of the Toronto Board of Trade, said that another period of car congestion was coming next fall and urged that the railways as well as the shippers should be penalized for delay. W. S. Tilston, traffic expert of the Montreal Board of Trade, urged that the car service should be administered by an official of the Dominion Board of Railway Commissioners. Frank Hawkins, secretary of the Canadian Lumbermen's Association, spoke in favor of a system of average demurrage. He gave a number of instances of delay in loading, placing, advising, etc.

Mr. Murphy, General Superintendent of Transportation for the C. P. R., presented statistics to show that the shippers and not the railway companies were responsible for delays in delivery. He claimed that a fifty per cent. quicker service could be given if shippers acted promptly in unloading. E. W. Beatty, counsel for the C. P. R., presented figures to show that the company had taken due steps to keep pace with growing traffic by bettering terminal and unloading facilities. Over \$18,000,000 had been spent on terminal facilities between 1906 and 1910 and last year \$1,000,000 had been spent on Montreal and Toronto terminals. During the present year \$2,029,700 would be spent at Toronto and \$1,618,000 at Montreal.

On behalf of the G. T. R., Superintendent of Transportation Crombie claimed that any delays in delivery were caused for the most part on the American side of the border rather than on the Canadian side.

The Board, after hearing the presentation of both sides of the case, reserved judgment.

Increased Lumber Rates on I. C. R.

A report from St. John, N.B., states that the I. C. R. has advanced freight rates on lumber to an extent which amounts in some cases to an increase of 60 per cent., which, according to some of the manufacturers, will have a serious effect on the manufacturing end of the industry. Lumber is already under such heavy charges that this addition is certain to be a serious burden. The expectation is that the increase in most cases will come out of the pockets of the manufacturers, although in a few cases the wholesaler will suffer. The new schedule is dated May 28th, to be of effect from June 2nd. The following table is given as showing the substantial difference between the old and the new rates on an average shipment of 10,000 superficial feet.

	Mileage	At old rate	At new rate	Extra Cost
St. John to Hampton	22	\$ 9.61	\$14.00	\$4.39
St. John to Sussex	43	12.25	17.50	5.25
St. John to Moncton	89	15.75	24.50	8.75
St. John to Amherst	137	21.00	29.75	8.75

The following table shows the new and old rates and increases which have come into effect:—

Distances	Cents per		
	100 lbs.	Old Rate	Increase P.C.
Not exceeding five miles	2½	2	25
Over 5 and not over 10 miles	3	2	50
Over 10 and not over 20 miles	3½	2½	40
Over 20 and not over 30 miles	4	2¾	45
Over 30 and not over 40 miles	4½	3¼	38
Over 40 and not over 50 miles	5	3½	42
Over 50 and not over 60 miles	5½	3¾	46
Over 60 and not over 70 miles	6	3¾	60
Over 70 and not over 80 miles	6½	4½	44
Over 80 and not over 90 miles	7	4½	55
Over 90 and not over 100 miles	7½	5	50
Over 100 and not over 125 miles	8	5½	45
Over 125 and not over 150 miles	8½	6	41

The list of lumber and forest products on which these rates apply includes; blocks (match, paving and last or hub in the rough), box shooks, clapboards, fence posts or rails, hoop and hoop poles, last block material (in the rough), lath, logs and bolts, lumber, pickets, piles, poles (telegraph, telephone, electric light, scaffold and trolley), pulpwood, shingles, spoke or handle billets, spool wood, ties and timber. These with one or two reservations are affected by the new rates.

Free Shingles Would Stimulate Canadian Industry

Mr. C. S. Battle, Vancouver, B.C., who is prominently connected with the shingle manufacturing industry of British Columbia, recently returned from a trip to Europe and the United States. In an interview, Mr. Battle expressed optimistic views regarding the outlook for the shingle industry, in view of the proposed removal of the duty upon shingles entering the United States. Mr. Battle remarked that there was every prospect of the duty being abolished. At present the duty upon lumber entering the United States from Canada varies from \$1.75 to \$2.75 per thousand feet, according to the amount of manufacturing which had been done upon it. The duty upon shingles amounts to 50c per thousand pieces. In the United States, considerable opposition is being voiced to the removal of the duty both on lumber and shingles, but as Mr. Battle remarked, the opposition is coming largely from the lumberman of the three western States, Oregon, Washington and Idaho.

"I think that the opposition to the removal of the duty on lumber has now practically been withdrawn, however," said Mr. Battle, "and that the lumbermen will concentrate their efforts to oppose the duty on shingles. This duty is now practically prohibitive, only a few high-grade shingles finding their way across the border." The removal of the duty on lumber, he thought, would have no great effect on the Canadian business, as the United States markets were well supplied with United States products and Canadians could not afford to undersell them. In the shingle business however, he was confident that a change of considerable magnitude would take place. "You see," he said, "there is not much cedar in the three western States adjacent to British Columbia. There is very little in Oregon and Idaho and while there is some in Washington the cedar area is strictly limited. I think that the removal of the duty will cause American shingle manufacturers to come to Canada. In fact, I know personally of two or three firms that are only waiting the decision of the Senate to move their plants here or to establish new plants. It will mean the creation of a great deal of wealth that is now practically wasted. The shingle men are the best conservers on earth. They pick up timber that has been regarded as useless; that has been lying on the ground for fifteen or twenty years; that has been partly burned or destroyed and has been passed up by the lumbermen, and they manufacture it into shingles for which, heretofore, there has not been a market."

In Fear of Canadian Shingles

Geo. D. McKay, timber inspector for British Columbia who recently returned from a visit to Seattle, Wash., reports that the shingle manufacturers and cedar loggers of Washington are already complaining that the proposed abolition of the duty upon shingles and rough lumber has affected them to the extent of from five to ten per cent. of their output. Mr. McKay visited the Washington Scalers' Association with a view to arranging for the classification of cedar logs. He reported that the standards in Washington are practically identical with those in British Columbia and that there was a good prospect of reaching a mutual understanding in regard to cedar logs by the first of July. It is expected to make two grades for cedar and spruce in addition to the three grades already recognized for fir and pine.

Albert E. Reed and Co's. Annual Report

The report of Albert E. Reed & Company, the well-known paper manufacturers, for the year ended March 31st last, submitted to the shareholders at the annual meeting, held in London, on Wednesday, the 11th inst., shows net profit, after meeting debenture interest, of £35,365, as against £48,540 for 1911-12, while including £71,668 brought forward, an increase of £16,600, the credit balance at the date of these accounts was £96,538, an advance of £3,300. The directors recommended a dividend of 7 per cent. on the ordinary shares, making 10 per cent. for the eighth year in succession, while £5,000 is again transferred to reserve, giving a total of £50,000 at credit of that fund, leaving £74,706 to be carried forward. The Board state that their operations were adversely affected during the period under review by the coal and dock strikes which occurred in this country, rendering it necessary to purchase large quantities of fuel at famine prices, in addition to which a considerable portion of the output of paper had to be delivered by motor and other vehicles, which added materially to the company's expenses. As labour conditions are now more settled, it may be anticipated that earnings will recover during the current year.

The proposed advances in freight rates on the Southern Railway and its connections in Western North Carolina which were to have gone into effect on May 30th have been suspended by the Interstate Commerce Commission until September 27th. These increases ranged from one-half cent to six and one-half cents per one hundred pounds.

Fire Takes Toll of Lumber Industry

Three Large Canadian Mills Destroyed—Smaller Mills Also Suffer—Bush Fires Causing Much Trouble for Camps

The splendid new mill of the Big River Lumber Company, at Prince Albert, Sask., was destroyed by fire on June 11th. The mill was one of the largest on the continent and the yards contain 30,000,000 feet of lumber. The destruction of this mill is one of the most serious losses that could have affected the lumber trade of the prairie provinces. The Big River Lumber Company spent in the neighborhood of three million dollars in the purchase of timber limits and the erection of a sawmill plant, offices, dwellings and other buildings.

Destroyed by fire—Mill of Big River Lumber Co., Big River, Sask.

The virgin forest was cleared for the site of the mill. A small town quickly sprang up and a thriving industrial settlement was produced. The mill was farther north than any other stationary mill in Canada and was located in a country, up to that time, entirely unsettled and little developed.

The equipment in the plant which has been destroyed was the most complete obtainable. The erection of the mill was commenced in July, 1910, and completed in September, 1911. The maximum output per day was between five hundred and six hundred thousand feet running day and night. When the mill commenced operations it employed five hundred and fifty men and another twenty-five hundred were employed in the bush. The winter's cut of logs totalled 90,000,000 feet. The plant also included a planing mill and a box manufacturing plant. The sawmill was 84 x 22 feet with an addition on one side 32 x 145 feet for the lath mill and on the other side 36 x 163 feet for a slab re-saw and other machinery. The power house was of solid brick 80 x 152 feet with metal roof. The fuel house was 24 x 48 feet also of brick with metal roof. The equipment of the sawmill included three single cutting band saws, a vertical and a horizontal re-saw, two lath machines with a capacity of 100,000 lath in ten hours and a re-saw, edger and trimmer for box making.

The three band mills had 8 foot wheels and 14 inch saws. The horizontal band re-saw for slabs had 8-foot wheels and 12-inch saws. The vertical band mill had 8-foot wheels and 12-inch saws.

The entire planing mill equipment consisted of Berlin high-speed machines, supplied by the Berlin Machine Works, Limited, Hamilton, Ont., including one No. 16 sizer and matcher, one No. 186 double

aved from the flames—Planing Mill of Big River Lumber Co., Big River, Sask.

surfacer, seven No. 90 fast feed planers and matchers, two band re-saws, etc. These were all direct connected to electric motors, through flexible couplings.

The company's limits cover a tract of 500 square miles, thickly timbered, with 90 per cent. spruce and 10 per cent. jack pine, the average of the logs being 20 pieces to a thousand feet.

The Big River Lumber Company was organized in 1909 with the following officers:—President, Col. A. D. Davidson, Ottawa; vice-

president, A. M. Nanton, Winnipeg; directors, R. J. Mackenzie, Winnipeg, John H. Munson, K.C., Winnipeg, and Wm. Cowan, Prince Albert.

The most recent reports from Prince Albert state that the loss included the sawmilling plant and that the offices, warehouse, power house, planing mill and general stores were saved. The fire is believed to have originated from a hot box soon after the mill started operating for the day. In forty-five minutes after the commencement of the fire the main building collapsed. The engine house which is fire proof is connected with the mill only by a large main driving belt. The belt was burnt off where it entered the engine house leaving the latter in tact. At the time of the fire, the mill was employing 650 men, of whom 400 are thrown out of work for the time being. The company have 30,000,000 feet of lumber in their yards and the shipping business will not be affected.

The loss is estimated at \$550,000 which is covered by insurance controlled by Osler, Hammond and Nanton, of Winnipeg.

Booth and Shannon Mill Destroyed

The village of Biscotasing on the C. P. R. between Cartier and Chapleau was completely destroyed by fire on the night of June 13th. The large mills and lumber yards of Booth and Shannon were completely destroyed. Twenty minutes from the time the fire reached the lumber yards, the whole plant and stock was burnt up. The blaze, which practically obliterated the town, originated in a small shack behind the Catholic church. Within an hour and a half the village had been completely destroyed. The total loss from the destruction of the village is estimated to be in the neighborhood of half a million dollars.

Fire Destroys Several Small Mills

A bush fire swept through the townships of Tudhope, Truax, Robillard and Dack in New Ontario about the middle of June and many people in the neighborhood and in the town of Charlton lost their homes and belongings. No such serious fire has taken place in Northern Ontario since the Porcupine fire of 1911. In addition to the farmers' homes which were destroyed by fire a number of small sawmills located in the woods were burnt and the lumber camps wiped out, together with much standing timber and pulpwood and other timber which had been cut during the past winter. The fire in the Long Lake section covered an area twelve miles in length and destroyed the saw and planing mill of the Northern Ontario Lumber Company which was located on the shore of Long Lake about a mile north of the town. The loss of the company is estimated at \$15,000.

The Smith Fassett Company, owners of a large sawmill almost in the town of Charlton had a difficult fight in preserving it from destruction. A number of the company's camps are reported to have been destroyed. The saw and planing mill of Jackson & West, in Martin township, three miles north of Englehart is reported to have been destroyed together with the personal effects of the men who were employed there.

Montreal Lumber Fire Has Fatal Results

Early on Sunday morning, June 22nd, the door, sash and blind factory of N. Sarrasin & Son, Limited, Duvernay and Levis streets, Montreal, was destroyed by fire. Four firemen were killed and several injured, owing to the sudden collapse of a wall. The firm employed about 80 men. The lower floor of the mill was occupied by the saws and planing machines, and the upper floors by the other woodworking equipment. There was a very high wind, and the flames and burning debris carried in all directions. At one time it looked as if the lumber yard of Mr. J. H. Redfern, nearby, could not escape destruction, but fortunately prompt measures saved the yard; Mr. Redfern however, had a kiln and a large amount of dry lumber burned, the loss being considerable. A warehouse, used for storing hardwood, belonging to William Rutherford & Sons Company, Limited, was also destroyed. N. Sarrasin & Son have insurance to the amount of \$45,000.

Flames Destroy Lumber Stocks

Campbell & Son, Hudson Township, near New Liskeard, Ont., recently lost a large quantity of rough lumber by fire and very narrowly escaped the loss of their mill. Bush fires are reported from many parts of Northern Ontario, although in connection with none of them is any serious damage reported.

Fassett Lumber Company's Plant Destroyed

Ottawa, June 24.—The sawmills, planing-mills, storehouses and a quantity of lumber valued at \$125,000, belonging to the Fassett Lumber Company located at Fassett, Que., were totally destroyed by fire yesterday. The lumber yards containing lumber valued at \$60,000 were saved after a hard battle by the employees of the company, who assisted in fighting the flames. As the result of the fire over 400 men will be out of employment pending the rebuilding of the mills, which,

Destroyed by fire—Fassett Lumber Company's mill, Fassett, P. Q.

it is expected, will be commenced at once. The Fassett Lumber Company is an American concern, Mr. J. Fassett of Elmira, N.Y., being the President. The plant has been in operation eight years. The cause of the blaze is unknown.

Last Block Plant a Prey to Flames

The last block factory belonging to Geo. Willard & Son, at McNeills Crossing, P.Q., was destroyed by fire on June 11th. The fire started about two hours after work had been suspended for the day. The flames spread so rapidly that nothing could be done to save the main building. Fortunately the long sheds in which a large quantity of blocks were stored ready for shipment were saved. The loss included the machinery and contents of the mill which amounted to several thousand dollars. A large quantity of logs in the yard were saved. It is not yet reported whether the company intend to rebuild.

An interesting description of the mill of Geo. Willard & Son was published in the Canada Lumberman of April 15th, 1913, from which we reproduce the following facts. Boot lasts up to the present have been made almost entirely of maple. The diminishing supply

Destroyed by fire—Geo. Willard & Son's mill, McNeil's Crossing, P. Q.

of this wood has compelled manufacturers to look for a substitute. One of the largest firms manufacturing maple last blocks in Canada is that of Geo. Willard & Son, McNeills Crossing, P.Q. This firm had under order at that time five car loads of birch last blocks which were being used as an experiment, to see if they would take the place of maple. Fifteen years ago manufacturing methods were rather primitive compared with those of to-day. The large maples were cut down and sawed into wheels or cross-sections which were then split with a broad axe and maul, the bark being peeled off by striking it with the back of an axe. Fifteen years ago Geo. Willard & Son, operated in this manner. Last season the same firm took out 125,000 feet of maple, all of which was converted into last blocks.

The mill which has been destroyed, had a capacity of 4,000 blocks every ten hours and was run night and day whenever sufficient hands were available for the purpose. In manufacturing the blocks a maple log is rolled on to a saw carriage and cut into cart wheels by a 60-inch circular saw. The log is fed to the saw by steam feed, as in an ordinary saw mill. The splitting operation is done with a 56-inch circular saw, the wheel of maple being placed on a platform running upon trucks which are placed on a V-shaped track. The platform is pushed to the saw by the operator's knee. The pieces of maple after being split are trimmed or shaped for the roughing lathes. The mill included four of these lathes and one bench saw. The lathes had a capacity of from 1,000 to 1,200 blocks every ten hours, according to the ability of the operator. After this operation the block is in shape roughly conforming to the outline of the finished last. It is then placed in a car and carried to the storage sheds to be piled up "cob-house" style for drying.

Seven years ago Mr. Geo. Willard found that the demand for last blocks in the Canadian market was not sufficient to keep his mill running to full capacity. He made a trip to England and was successful in arranging contracts which have been continued every year since that date for the sale of all the blocks he could manufacture.

Forest Fire Destroys Camp Equipment and Logs

A forest fire occurred, during the second week of June, near Taft, B.C., which, for a time, obtained threatening proportions. The fire is said to have originated from a spark from a donkey loader. A strong breeze prevailed at the time and the flames soon covered a space of two square miles. A donkey engine, loader and three cars, together with over two million feet of logs were destroyed. Fortunately a heavy rainfall came in time to prevent further damage.

Timberlands Destroyed in Nova Scotia

Reports from Windsor, N.S., state that a serious forest fire commenced in the Sterling woods on the Meander River, Brooklyn, Hants County, during the second week in June. At that time the fire covered half a mile in width and two miles in length and was doing enormous damage. Valuable timberlands had already been destroyed and the fire was raging unchecked. Another report told of a forest fire near Faulbach Lake, in Lunenburg County.

Partington Company Has Narrow Escape

The Edward Partington Pulp & Paper Company, Limited, had a narrow escape from losing its stock of logs, amounting to about 17,000,000 feet by fire recently. Fortunately the flames, which destroyed a barn close by, were finally put out before they reached the Partington Company's property.

Ontario Will Sell More Pulpwood

Tenders which have recently been called for the right to cut pulpwood in the district of Kenora, Ont., comprise two parcels, the first being situated along the limits of the townships of Haycock and Petty-piece about twelve miles to the north east angle of township No. 41. It also runs along the shore of the Lake of the Woods to the mouth of Long Lake River. This parcel measures about 1,730 square miles. Parcel No. 2 is land west of the Lake of the Woods on what is known as the Western Peninsula, extending as far west as the interprovincial boundary between Ontario and Manitoba and contains 130 square miles. Some of the conditions under which pulpwood may be cut on this tender are:

That the successful tenderer shall expend \$500,000 in a pulp mill and equipment, the mill to cost not less than \$400,000 and that the daily output of pulp shall be not less than 75 tons, which must be made into paper in the Dominion of Canada and an average of 187 hands must be employed for at least ten months every year. The expenditure of the \$500,000 may be split up over a period of three years. Spruce, balsam, jack-pine, poplar and white wood trees may be cut, provided they are 7 inches in diameter, 2 feet from the ground. All necessary surveying fees are to be paid by the successful tenderer.

The dues are 40c per cord for spruce and 20c per cord for the other woods, or whatever rates are made from time to time.

The other conditions do not vary much from those usually stipulated. Tenders will be received up to and including the 15th day of August, by the Hon. W. H. Hearst, Minister of Lands, Forests and Mines for the province of Ontario.

Hoo-Hoo Concatenation at Toronto in August

R. H. Webb, of The Webb Lumber Company, Limited, Toronto, has been appointed vicegerent snark for eastern Canada, of the Concatenated Order of Hoo-Hoo. The indications are strong that this means a lively time for Hoo-Hoo in eastern Canada. No time is being lost in stirring matters up, as a concatenation is already planned to be held at the King Edward Hotel, Toronto, in August. All members who can round up any stray kittens in their offices or elsewhere are expected to fetch them along.

Stocks That Need Careful Handling

Mahogany Lumber Tenderly Cared For—Outline of Trade Conducted by an Important Toronto Firm

In the Canada Lumberman of June 15th an illustrated article was published describing the operations of the Wilson Lumber Company, Limited, Toronto, who make a specialty of the manufacture and sale of hardwoods. One of the principal lines handled by the Wilson Lumber Company is South African mahogany, and we are able to reproduce in the present issue, photographs showing some of their stocks of this valuable wood which recently arrived from Liverpool. The shipment consisted of six carloads, about 36,500 feet, which left Liverpool on April 24th on the steamer Bohemia coming by way of Boston. The stocks of which it was composed were from Grand Bassan, Benin and Grand Lahou. They were sawn at Liverpool and bought there by a representative of the Wilson Lumber Company at one of the periodical auction sales. The stock in this shipment will practically all be converted into furniture and show cases. A small proportion will be used for the interior trim of motor boats. Part of the shipment was immediately forwarded to Jones Bros., Dundas, Ont., manufacturers of high grade interior fittings.

Highly Figured and Scented Stocks

Most of this stock is highly figured wood and some of it is scented. Scented mahogany coming from Grand Bassan, is not imported into Canada in very large quantities. A number of the boards received in this shipment were exceptionally large, many of them containing 66 feet and running up to 24 feet long. In the preparation of mahogany lumber for shipments, the logs are sawn and the product of each log is banded together, so that the purchaser secures his stocks in convenient log form. The mahogany boards when sawn are usually "pegged," so as to allow free circulation of air. They are left in this condition for about six weeks before shipment. This treatment also improves the color of the stock.

The accompanying illustrations give an excellent idea of the careful manner in which the company handle and pile their mahogany stocks.

Trade Conditions in Saskatchewan

The Big River Lumber Company, Limited, whose mill at Big River, Sask., was recently destroyed by fire, wrote the Canada Lumberman a few days before the fire, in reply to an enquiry regarding trade conditions. They report that although they have no figures of the actual cut of spruce in their district during the past winter, they understand that nearly all operators, in fact all whom they had met, have taken out the usual quantity. In their own case they started up in the spring with about 90,000,000 feet of logs and commenced operating the mill as soon as the ice went out of the lake, viz., during the last week in April. From that time until the date of the fire they had been operating the sawmill and planing mill both night and day. They were averaging over 500,000 feet through the sawmill and approximately 400,000 feet through the planing mill per day of twenty hours.

In discussing the market they report that the cold backward spring, together with the universal tightness of money made the demand for lumber considerably slower than last year at that time. Lumber dealers all over the prairies were simply carrying a hand-to-mouth stock and only ordering when and as they absolutely required it, in order to take care of their business.

In their own case, the Big River Lumber Company reported that while the demand was sufficient to keep their plant in operation for full capacity, they were not loaded up with orders which would

Taking no risks—Mahogany stocks handled with extreme care.

keep them going for months ahead as they were at the same time last year. The weather conditions had become ideal early in June and the indications were that trade would improve greatly from then on.

Encouraging Outlook for Trout Creek Companies

A Board meeting of the Dominion Wood & Lumber Company was recently held at Trout Creek, Ont., at which reports were presented showing the cost of erecting the building and putting everything in shape for the chemical end of the operation. It was shown that the plant was running in a very satisfactory manner and that it had been completed well within the estimated cost. From the figures shown by the manager for the first two week's operations, the board were highly pleased with the promise for the success of the plant.

The Trout Creek Logging Company, Limited, also held a meeting of its directors, who subsequently went over the logging railroad, inspected the sawmills and operation of the plants and found conditions most satisfactory. The sawmill is now running at its full capacity.

The Ballantyne Lumber Company also held a meeting of its directors at Trout Creek. The report showed a very satisfactory year's operations, although, owing to the bad winter conditions, logging operations had been conducted at a considerably higher cost than in former years.

New Brunswick Lumbermen's Meeting

A meeting of the Association of Lumbermen and Limit-holders of New Brunswick was held on June 16th at St. John, N.B., for the purpose of reorganizing. One of the most important matters discussed was the legislation recently passed in New Brunswick, affecting the lumber industry. A delegation was appointed to wait upon the provincial government in connection with this question. Among those who attended the meeting in addition to most of the St. John members were the following:—John P. Burchill, president, Nelson; R. A. Lawlor, secretary-treasurer, Chatham; Allan Ritchie, W. M. Sinclair, A. Kulinder, James A. Rundle and David J. Buckley, of Newcastle; Angus McLean, Bathurst; F. D. Swim, C. S. Hickman, Dorchester; Sheriff John O'Brien, Nelson; James Robinson, Miramichi; J. W. Brankley, Chatham; C. L. Fenderson, Jacquet River, and John Kilburn, VanBuren.

Ontario Lumber Salesmen

Men Who Keep the Stocks Moving

J. P. Johnson, Toronto

If there were one man in the wholesale lumber business in Ontario, who is known to every important retailer in the province, it would be an easy matter to name him. It would be easy enough also to state the general opinion of the trade in regard to him. J. P. Johnson, of the firm of Campbell & Johnson, Traders Bank Building, Toronto, is one of those men who are welcomed everywhere, whether they come to sell a car load of lumber or to collect a bill. Very little, if any, of the latter duty falls to his lot, but it is safe to say that most men, after being interviewed by Mr. Johnson upon a matter of business, feel as though they were under an obligation to him and his firm for doing business with them. Geniality and shrewdness are combined in his make-up in a most exceptional manner, and the combination is so nicely balanced that when the latter characteristic is in play, it seems always to be subordinated to the former. These characteristics, so essential in the equipment of a successful lumber salesman are natural gifts in Mr. Johnson's case and their value has been increased by his incessant attention to the acquisition of an extensive and accurate fund of information upon all questions of importance to the trade.

J. P. Johnson, Toronto, Ont.

Mr. Johnson was born in 1864 at Picton, Prince Edward County, Ontario, on the 11th of December. His early days were not unlike the early days of all healthy young Canadians. He attended public and high school and, when his education was completed, commenced his business career with his father, Mr. J. S. Johnson, in the retail lumber and coal business at Picton. Since that date Mr. Johnson has been connected continuously with the lumber business. In fact it may be said that, from the time he was eight years old, he has been absorbing information and experience regarding lumber matters. One may say of Mr. Johnson, with strict truth, that he was born with his feet in the sawdust. He was sixteen years of age when he commenced to earn money in his father's business and he devoted his time to this employment for a period of four years, until Mr. Johnson, Sr., sold his business to the Rathbun Company. Then Mr. Johnson sallied forth to find experience and livelihood with the well-known firm of J. K. Post & Company, wholesale lumber dealers. With this company he had charge of their inspection for eastern shipments and obtained an intimate acquaintance with a wide variety of lumber.

After four or five years of inspection work, Mr. Johnson went upon the road and quickly proved himself a natural born salesman. After a period upon the road he was engaged for about seven years in the wholesale hardwood business, after which he came to Toronto and continued in the lumber business up to the present time with the exception of a period of two years. In Toronto he was engaged with the Victoria Harbor Lumber Company for six years acting as traveling salesman and proving himself one of the most efficient and widely respected salesmen upon the road. In January, 1907, Mr. Johnson became a member of the firm of Campbell and Johnson and has continued upon the road for that firm up to the present.

"What of the Future of the Retail Lumber Business"

By J. H. Foresman

In the past the retail lumber business has been reasonably profitable. While it is not a "get-rich-quick" business, it is what one might consider as safe and staple, and has usually made moderately good returns on the capital invested for time and energy spent, says J. H. Foresman, in the St. Louis Lumberman. The styles of lumber do not change much, nor frequently, as is true in many other retail lines. Dead stock does not accumulate that has to be sold at a sacrifice, as is true in many other lines of merchandising, and losses by bad accounts are, perhaps, much lower than in almost any other retail lines.

The man who runs a retail lumber yard is engaged in one of the

most healthful and agreeable occupations, because of being able to spend perhaps one-half of his time in the out of doors.

As to the future, it is certain that profits will not be as good as in the past, on account of more restricted territory and increasing competition. Gross profits are, at least in most sections, steadily decreasing, while at the same time the expense, because of increased salaries and taxes, are increasing. The stock in the yard costs a great deal more than was true in years past, hence the investment has almost doubled in a little over a decade. Fifteen years ago the wholesale price of such staple items as No. 1 dimension, B Flooring and No. 1 boards ranged from \$13 to \$16 on a 23c rate; now the same stock costs from \$22 to \$29, the per cent. increase is quite large. The building of improvements because of the increase in the price of lumber makes the improvement account much more, real estate is higher, so that while \$10,000 would have handled a moderately sized yard fifteen years ago, it now requires \$15,000 to \$20,000 to handle a similar yard. Fifteen years ago the customary salary paid the manager in an ordinary yard was from 25 per cent to 50 per cent. less than it is today. Possibly the number of dollars gross profit on each thousand feet of lumber sold is as great now as formerly, but the gross per cent. on sales is much less. During the last several years the gross per cent. profit on sales of the company with which I am connected decreased quite a good deal, and I am of the opinion that other lineyard concerns have had similar experiences. During the same period the expense to sell has increased, therefore the net profit has taken a slide down toward the vanishing point. Then, what of the future? Will expenses and investments go on increasing? Will profits continue to shrink? Will the forests all eventually be devastated, and the retailer of lumber be without an occupation entirely? I do not believe the last named alternative will ever come to pass. True the statisticians tell us that the Southern forests will be gone in fifteen years, and that the western timber will last for only forty years, but when I remember the prediction made concerning white pine in the north in years gone by, I am confident that the retailer will be handling yellow pine as a staple building wood for at least twenty-five years and the western product for perhaps fifty years or more. Then, there will be the supply from the national forests in perpetuity, although in more or less restricted quantity. There are forests in the interior of Mexico and South America that will be exploited in the distant future, and there will doubtless be more or less lumber from re-forested areas, either by private owners or by national governments. The use of substitutes will doubtless increase as the price of lumber continues to appreciate, but this will affect the manufacturers rather than the retailer. The latter has already become a dealer in "building material," rather than a lumberman exclusively, and whereas his stationery fifteen years ago usually bore the headings: "Dealer in Lumber, Lath, Shingles, Lime, Hair, Sash, Doors, Blinds, etc.," the letter heads of perhaps a majority of dealers to-day read something like this: "Dealer in all kinds of Building Material." And why is it that the old-time lumberman has developed into a merchant dealing in such a multiplicity of articles formerly not carried in the lumber yard? Is it because building operations have assumed a different aspect and call for more numerous and diversified materials? Or have increasing competition and decreasing profits forced the retailer to add to his line in order to continue in business?

Both of these causes have, no doubt, contributed. It is true that more and more yards each year are adding coal, hardware, implements, furniture, vehicles, feed and so on, to the single line with which the old-time lumberman was content. This branching out into different lines is an evolution of the business characteristics, especially of the past five years.

Our company have added five hardware stocks in connection with its yards during the year just past, and it now seems probable that this policy will be continued. At one point we carry coffins, at one implements, and at another wagons, etc. We may be selling automobiles in another year, if the territory in which we operate should have abundant crops. Of course this expansion of business entails larger investments, increased expenses and the investment of funds in larger buildings and improvements.

In the handling of these several lines the dealer comes into competition with his former fellow lumberman, also with the hardware man, implement dealer, mill and elevator, coal man, etc. All this spreading out of the business, the increased competition and the wider field to look after, requires a higher order of business ability than formerly required, and the lumberman of the future must necessarily work harder, read more, study his methods more carefully, and in short, become a higher grade man.

The dealer in all kinds of building material will replace the old-time seller of lumber alone, and in most cases one or all of the lines before enumerated will be incorporated with it. The retailer should study the trend of the times, the forces making for the inevitable developments of the future and so adjust himself to them that he will not be left a stranded victim on the rocks of adversity, as the progress of the business world of which he is a part moves steadily onward.

New Brunswick's Crown Timber Act

Interesting Analysis of Its Provisions By One of The Province's Most Successful Paper Manufacturers

The act respecting the Crown timber lands of the Province of New Brunswick, which was passed and became law on the twentieth of March this year, has mainly for its object the continuation of existing lumber licenses and the fostering of other industries, such as pulp and paper manufacture. For some time prior to the foregoing date the present timber limit holders had been urging the government to reveal their policy in respect to these Crown Land leases, and this act embodies the government's expression on this very important question. The Crown Lands cover an area of nearly ten thousand square miles and unquestionably form a most valuable asset of the State since the bulk of the revenue obtained by the government is collected from these lands in the form of mileage and stumpage.

Twenty years ago leases covering a period of twenty-five years, renewable annually, were sold at auction at what was then considered fair competitive market value. In this way lumbermen acquired the right to cut over specified areas. Since then the values of these licenses have increased. Throughout this period a uniform mileage has been levied of eight dollars per square mile per annum, together with a stumpage tax varying with the kind of timber cut, and in accordance with the general rise in the price of sawn lumber. In 1895, this stumpage was \$1 per thousand feet B.M. for spruce, but during the past few years it has been raised to \$1.25 per thousand. These leases do not carry with them any soil rights but simply permission to cut trees of a certain size on well defined areas which have been set aside for the exclusive use of the purchaser of them during the tenure of his lease, and on fulfillment of certain obligations on the part of the holder.

Originally, that is in 1895, the limit in respect to size of trees to be cut under the license was 10 inches diameter, sixteen feet from the ground, but more recently, owing to the increasing difficulty in obtaining saw logs of that size, the limit in diameter was reduced to 9 inches. The government retained the right to modify the taxes both with regard to mileage and stumpage as they thought fit, as well as to impose fines, even to the extent of confiscation of any lease, for persistent violation of the law, or non-fulfillment of the terms of the lease. All leases are transferable, or can be sold or transferred to another party, and if any "fall in" from whatever cause, the government retains the right to sell at auction to the highest bidder.

Provisions of the New Act

The provisions of the new Act, which repeals all other acts inconsistent with it, and particularly the Public Domains Act of the Liberal Government of a few years ago, do not seek to modify in any way the power of the government to alter their charges or dues, or indeed to forego any other rights it enjoyed under the old Act, but simply increase its powers.

(1) To create two new kinds of licenses to be exchanged for the old on payment of a monetary bonus, namely:—

- (a) A 30 years' lumber license for the exclusive use of the saw-mill owner.
- (b) A 50 years' pulp and paper license for those who desire to manufacture pulp and paper, or the products thereof, as well as lumber.

"A" can be exchanged for "B" at any time.

(2) To make a survey of the Crown Lands chiefly with a view to ascertain the extent and nature of the standing lumber thereon, and without special regard to the nature of the soil.

(3) To make a readjustment of the holdings in accordance with the ascertained requirements from actual survey of the individual holders.

Although exception may be taken to this new Act as being in matters of detail somewhat indefinite in its terms, and subject to wide interpretation, yet no one who understands the conditions prevailing in New Brunswick can deny that its operation, if carried out in the right spirit, will have a very beneficial effect on the business of the province. The Act indeed is very comprehensive and lucid in its intention, but its usefulness will depend on the interpretation which the government gives to some of its clauses. New Brunswick possesses such a large area of non-agricultural land, and such extensive forests that lumbering and the allied industries will flourish there for many years to come provided proper means are adopted to protect its forests. Besides it is provided with good railroad facilities, good

**James Beveridge, of Millerton, N.B.,
Sees Encouraging Indications for
the Future in Premier Flemming's
New Crown Timber Lands Act.**

water ways for the cheap transport of lumber, cheap coal from the neighboring Province of Nova Scotia, and comparatively cheap labor. This Bill is a serious attempt to protect those industries already established and to foster others which depend upon the forest for their existence.

First and foremost the Act gives fixity of tenure in the Crown Land licenses for a definite period so that lumbermen and others now know precisely where they stand in regard to the future.

This extension of tenure is to be granted on payment of a bonus to be fixed by the Lieutenant-Governor-in-Council, but what this bonus will amount to has not yet been revealed. It is hoped, however, by those interested, that it will be placed on a moderate basis.

Encouraging New Enterprises

Then the Act wisely makes provision for an extension of the pulp and paper industry, seeking to induce fresh enterprises in these manufactures to come into the province, and offers possibilities to present limit holders hitherto unknown to them. The "Pulp and Paper License" stipulates that "at least fifty per cent. of the lumber cut under such license shall be manufactured into pulp and paper or other manufactures of pulp within the province." Direct inducements are thus offered to the licensees to embark on these important manufactures, or to ally themselves with others who would be willing to do so. The object of the government is easily understood in formulating this clause. Obviously it is two-fold, first, the utilization of the enormous amount of waste occurring in the forest itself and in the sawmills by converting that waste into useful high class commercial products; and second, fostering an industry which, on a strictly comparable basis, is of greater benefit to the community than log sawing.

In point of fact this Act is a wholesome and straightforward effort not only to protect the capital already invested in these Crown lands by licensees and in the plant and machinery of the lumber mills, but also to benefit the community at large by offering inducements to further industrial development along the most economic lines for the State. This is the highest office of government and Premier Flemming is to be congratulated on his efforts to produce an Act which will yield a maximum return to the wage earning class from a minimum of raw material.

The Act taken as a whole is framed on equitable lines and if any controversy can arise from its terms, it will be under those clauses dealing with the general survey of the timber areas held under each lease, with a view to assess their commercial value. This general survey involves such a mass of details that it seems doubtful if a true estimate of the value of each holding can be arrived at without prolonged and very careful investigation. The provision made for this in the Act seems adequate, and if the truth can be reached the investigation should prove of the utmost value to the government. Whether or not the bonus to be paid for the extension of these leases is to be based on this investigation is not clearly stated in the text of the Act, but it seems to us that such is the intention. It is the assessment of these values which appears to us to be open to dispute and dissatisfaction.

U. S. Wood Pulp Importers to Receive \$3,000,000

The United States will give up \$3,000,000 to European importers of woodpulp and paper as a result of the Treasury Department's decision to-day not to appeal to the Supreme Court from the recent decision of the Customs Court that all countries having "favored nation" treaties with the United States were entitled to free woodpulp and paper because that privilege was granted to Canada. The importations were made from France, Germany, Norway, Sweden, Denmark, and other European countries.

Arthur D. Little, Incorporated, 93 Broad Street, Boston, Mass., announce the establishment of a forest products department under the direction of Dr. L. F. Hawley, formerly in charge of the section of wood distillation and chemistry of the United States Forest Service. This department will be fully equipped for efficiency studies, the examination of new processes, or the solution of any problem in connection with turpentine, rosin, or other forest products, wood distillation, or the utilization of wood wastes.

The Selection of Belts and Pulleys

Importance of Ascertaining the Proper Size to Use for Each Particular Purpose—
Manufacturers Furnish Valuable Information

By W. F. Schaphorst

It is a common failing for nearly every mechanic to think that he knows as much as need be known about belts. Perhaps this is due to the simplicity of belt contrivances. A strip of leather running around a pair of plain pulleys does not appear a bit complex. "We don't care anything about the technicalities. All we want is something that will make the wheels go 'round and keep them a-going." That is the philosophy of many of the belt users in saw mills, wood-working shops and in a great many machine shops and power plants that are otherwise very well managed.

Let us begin at the beginning and say why we think there is so little to know about belts. I am the owner, let us say, of a wood-working plant. I want to install a band resaw in my plant. I send for literature to various advertisers of such machinery. These catalogs usually contain plenty of good pictures and complete descriptions of the machines themselves—the weight of the machine, size of band saw wheels, rates of feed, sizes of pulleys, height, and space requirements. But, the width of belt necessary to drive the machine, the kind of belt, the thickness of the belt and the horse-power required to drive the machine are all omitted, yet every item omitted is important.

Transmission Feature Neglected

Many purchasers will go ahead and buy the machine without considering the transmission end of it. The writer has done so himself in installing similar machines. Transmission is frequently considered so unimportant that it is given no thought at all. As soon as the machine arrives the "boss" looks at the pulley, "estimates" that a 6-inch belt will do the trick (the width of the pulley is $8\frac{1}{2}$ inches) and sends an apprentice boy for a length of belt that the boss roughly stepped off. "Forty-eight feet" he tells the lad "will be a-plenty." The boy goes to Jones' hardware store where he knows the firm runs an account, and informs a salesman that his boss wants 48 ft. of 6-inch "belt." Without asking a single question the salesman selects a roll of leather belting that he "thinks" the boy wants. The boy totes the belt to the shop.

After giving the belt a cursory glance the boss immediately orders one of his poorest mechanics to "belt 'er up." The mechanic obeys and with the aid of the apprentic boy determines the length of the belt by the common cut-and-try method. His first trial proves that in his judgment the belt would be a little too slack, so he takes off three inches more. It looks a little better to him but he decides it is not quite enough yet. After a third cutting he concludes that enough has been cut off but find the belt ends aren't exactly square, which necessitates a little more trimming. By the time he has finished and has laced the ends together according to a lacing method of his own which he invents on the spot, the belt is as tight as the proverbial drum string. He announces the completion of his "job" to the boss who hastens over, "judges" the tightness of the belt with his hand and "surmises" that the belt is "a little too tight." "But," he adds, "it will soon stretch." "All new belts," he agrees with the mechanic, "should be made very tight."

They oil the machine, turn on the power, and give the machine an initial trial. The belt is forgotten and will it all probability never be thought of again until it causes a hot box, runs off, or slips so much that it screeches.

Such is the method that is followed in a large majority of cases where small machines are involved, especially where the driving pulley comes with the machine. The selection of the belt is a combined guess and accident. And curiously enough, in nearly every case the belt does the work. This is undoubtedly because designers of pulleys are students of psychology. They know that it is best to give a pulley ample width.

The selection of a belt should be given more serious consideration. The manufacturers of the machine should recommend a proper width, thickness, and make of belt, and they should also give the power requirements of the machine. Not infrequently the installation of a new machine under conditions similar to the above necessitates the addition of more motive power or the shutting down of other machinery during the operation of the new one in order that the latter may be run at proper speed. The transmission problem should be solved before the new machine is installed.

Information Furnished by Manufacturers

Manufacturers of large power-consuming machinery now-a-days make it a practice to employ engineers or skilled mechanics as salesmen both in the field and in the office. These salesmen can usually be depended on to give reliable information. They know from ex-

perience that it pays to be truthful in making claims for their wares. It is their business to make the transaction an economical and satisfactory one for the purchaser as well as a profitable one for the manufacturer. Should failure occur even in the belting the purchaser is liable to blame the manufacturer, especially if the latter has given advice concerning the belt. The seller finds it poor business to be "blamed" for anything, hence endeavors to answer all queries correctly.

The average belt user does not like to bother with the theory of belts and pulleys, and the writer sympathizes with him. The mathematics involved in the theory of belts is too cumbersome. It is much easier and usually better to put the problem up to the manufacturers who are well acquainted with its peculiarities and who can back their recommendations with precedent. Should an inexperienced man attempt to solve a belt problem he would probably distrust his own figures anyway. Even the scientist who has devoted much time to belts is sometimes reluctant to make a definite statement. For example, at a meeting of the American Society of Mechanical Engineers several years ago, at which a lengthy paper on belts was read by Mr. Barth, this question was asked by a member who participated in the discussion: "I would like to ask Mr. Barth or any engineer present whether he would use the same size belt with the 6-inch pulley as the driver, as with it as a driven, and with the same size of pulley, and whether in this case it would last longer, other conditions being equal." It sounds simple, but to the writer's knowledge that question has not yet been satisfactorily answered and perhaps it never will be. Although the mathematics of belts is so well known that a mathematician can "compute" closely the sizes needed, there might be some practical hindrance to the adoption of the mathematician's results. Experience and judgment must be well mixed with the mathematics.

Belt Formulae vs. Experience

The fundamental belt formule upon which calculations are based in determining the size of belts and pulleys as, to most belt users, a most complicated and technical affair. Briefly, it takes into con-

sideration the tension on the tight and loose sides of the pulley, the angle subtended by the belt in contact on the small pulley and the coefficient of friction of the particular belt under consideration. With each of these factors determined a good mathematician has the facts upon which to find out how wide a belt or pulley he requires. But how many mill men are able to solve such a problem? Take a four foot pulley for instance, delivering 30 h.p. to a 2-foot pulley, with the centres 25 feet apart and the driving pulley making 300 r.p.m. The writer has gone through the very tedious "scientific" solution of this problem for the width of the pulley, with a belt having a coefficient of friction of 0.25. Anyone who works it out successfully will find that the belt should be between 8 in. and 9 in. wide, with a working tension of 300 pounds per square inch and a belt 0.20 in. thick. Each inch of such a belt would carry a force of 300 lbs. x 0.20 or 60 lbs.

The writer uses this complex method only when in doubt about other methods although he has a wholesome respect for the much quoted Mr. Rankine who first derived it as well as for scientists who still use it.

Many bewildering belt formulas have been developed, but, correct as these may be, their very appearance discourages most men, and, when they are used the designer frequently enlarges the result anyway, should he "judge" the belt unsafe. Why not use a good reliable tried and true rule-of-thumb in the first place? Here is one as given by Chas A. Schieren, Jr.:

"A good transmission rule, and one that leaves sufficient reserve power in the belt, is to divide the number of feet that the belt travels per minute by 800; the result is the number of horse-power that a 1-inch single belt will transmit; in other words, if a belt travels 2400 feet per minute, according to this rule a 1-inch single belt under this condition would transmit three horse-power, a 10-inch belt 30 horse-power, and so on.

"A good rule for double belts is to divide the number of feet

that the belt runs per minute by 500; the result is the number of horse-power that a 1-inch double belt will transmit. In other words, a double belt 1-inch wide running 2500 feet per minute will transmit 5 horse-power, and wider belts in direct proportion.

"These are both old rules and they are safe."

Applying this rule to the problem that we have just discussed we find that each inch of width of the belt will transmit

$$3770 \div 800 = 4.71 \text{ horse-power}$$

The belt must therefore be $30 \div 4.71 = 6.5$ inches wide.

To be on the side of safety we will decide on an 8-inch belt inasmuch as our previous method resulted in approximately that dimension. Knowing that the above rule is much used, and is generally reliable, the writer would recommend an 8-inch belt in an indoor woodworking plant, a 10-inch belt in an out-of-doors saw mill or other plant where dampness and dust are unavoidable. Where surroundings are unusually wet or greasy or where there is great danger of slipping, a 12 or even a 14-inch belt might be used.

A drive to which the rule-of-thumb does not apply satisfactorily is shown below.

Here we have a large pulley transmitting power to a small pulley (all other conditions are the same as before), on very short centers. The contact arc on the small pulley is small. Still, application of the "rule" will not increase the width of belt although we know that greater tension is necessary in order to create greater friction, or, the arc of contact on the smaller pulley must be increased either by treating and slackening the belt or by the use of an idler. Without recourse to either of these methods the first formula given tells us that a 9.7 inch belt will be needed.

It is therefore evident that judgment plays an important part in the determination of belt sizes. In using the Rankine formula we judge the coefficient of friction. After we apply the simple rule of thumb we again use our judgment, thereby arriving at about the same that would be obtained through a more elaborate process.

The Right Size of Pulleys

To determine the size of pulley needed for any machine the r.p.m. of that pulley and the r.p.m. of the driving pulley must be known. A circular saw, for example, is rigidly connected with the driven pulley to a common shaft. The saw must make 1000 r.p.m. The line shaft from which power is to be belted makes 400 r.p.m. 1000 divided by 400 = 2.5. The driving pulley must therefore be 2.5 times as large as the driven pulley. A 6 in. driven pulley and a 15 in. driving pulley would then have the correct ratio. Now, whether they are the correct sizes or not depends upon the horse-power to be transmitted. Small pulleys are satisfactory where belts are thin and pliable and where little energy is to be transmitted, but they are not so satisfactory where considerable energy is to be carried. To be sure that pulley sizes are correct the manufacturer, as stated before, should be consulted or a similar installation should be inspected. The manufacturer, of course, will base his recommendations on results of experience.

Because of the varying coefficient of friction for different materials, it is obvious that pulleys made of different materials will pull varying loads.

Application of the above belt rule, however, tells us that we need an 8-inch belt. We know that a pulley should be as wide as or wider than the belt. Pulleys 9 inches in width will therefore suffice and we will select the one that in our "judgment" best combines dependability, economy, and handiness.

It is now obvious that on account of the inter-relation of belts and pulleys we cannot decide one before we have considered the other. Before the type and width of pulley can be chosen for any machine we must compute or obtain from tables and curves the width and thickness of belt desired. On the other hand the width and thickness of belt cannot be correctly fixed until the diameters of the pulleys are known. The larger the diameter of the pulleys for a given power, the smaller the cross-sectional area of the belt.

J. & W. Duncan, Limited, 1833 Ontario Street East, Montreal, have commenced the erection of a planing mill to cost \$5,000. The building will be two storeys, 25 x 80, with felt and gravel roof.

The Abitibi Pulp & Paper Company is expected shortly to make a new issue of stock. Estimates indicate that the company will show an annual profit of not less than \$340,000. This is based on an annual output of 45,000 to 50,000 tons of wood pulp.

Interest Upon Overcharge Claims

U. S. Railroads Giving Better Attention to Complaints Since Recent Ruling Became Effective

At the recent meeting of the National Hardwood Lumber Association, the transportation committee, referred to the question of interest upon overcharge claims. This matter had come up before the Interstate Commerce Commission and an important ruling had been given, in the following words:—"That on all unsettled claims for overcharges, carriers must pay interest from the time the charges were improperly collected." From this it will be seen that the shippers at last have an effective right which, if exercised, will do much to correct the delay in adjusting claims. The transportation committee of the Association gave it as their opinion that since the making of this rule, railroads had been giving more prompt and better attention to claims for overcharge. The same situation as led up to this ruling in the United States exists today in Canada and lumbermen and shippers in general, if they would present their case forcibly before the Dominion Board of Railway Commissioners should run a good chance of having a similar ruling passed in connection with railroads operating in Canada.

Railways Seeking Rate Advances

Another matter which was brought up by the report of the Transportation Committee was the agitation on the part of the railroads for advanced freight rates. "There is no doubt," the report said, "that the railroads will soon make a concentrated effort towards a general advance, and whether or not the business of the country can stand advances, is a question that must sooner or later be definitely decided. It is a well-known fact that the volume of traffic has greatly exceeded the growth of the facilities of the railroads and extensive additions and improvements will have to be made promptly in order to give any effective relief. The railroads claim that the present rates do not give sufficient returns to enable them to make such improvements, due to the fact that expenses have gone up rapidly during the last few years. Increased wages and legislation, both federal and state, have had an important influence upon expenses, and the railroads claim that a general increase of rates is imperative. The recent bulletin, issued by the Bureau of Railway Economics at Washington, D. C., shows by statistics compiled, that the capital value of railway properties is increasing less than half as fast as the capital values of either the agricultural or manufacturing industries, and also that the percentage of the net return on capital in manufacture is over twice as high as on railways. The shippers will have to be well prepared to present their side of the case strongly, in order that a standard of fairness for all concerned may be maintained. Nothing is to be gained by antagonizing the railroads, and it will be best for all interests to discuss the matter thoroughly, and test it out fairly in a friendly manner, rather than assume an aggressive, belligerent attitude. That the majority of the carriers have made an effort to gain the goodwill and favor of the public is evident, and to accomplish this, they have devised several plans which have really done much towards the improvement of general conditions. The railroads have recently endeavored to show that they are at the service of the public, and in some instances, officials of authority have accompanied special trains in order that any grievances in the community visited could be immediately brought to the attention of the proper officials, and adjusted at once. This attitude indicates a willingness to co-operate with the public, and a desire for a reasonable hearing to acquaint the public with their needs which should be reciprocated by the shippers. It is to be remembered, however, that the shippers have rights which must not be waived or overlooked, and that they are prepared to protect their interests.

"The railroads have already attempted to raise rates in several instances, but protests were filed with the Interstate Commerce Commission, and suspension of the tariffs providing such advances were ordered until full investigation could be made."

Ontario Using More B. C. Fir

Mr. Hugh A. Rose, Toronto representative of the Canadian Western Lumber Company, New Westminster, N.Y., reports that he has recently sold 500,000 feet of fir timber for ceilings, sidings and flooring for stations on the National Transcontinental Railway east and west of Cochrane. This order was taken in competition with native lumber. Mr. Rose is of the opinion that manufactured fir is making great headway and will shortly come into more common use in this territory. The Canadian Western Lumber Company have recently shipped a double car load of fir timber (up to 56 feet long) from Fraser Mills, B.C., to Halifax, N.S., and thence by steamer to Port Nelson. This is a rush order and was telegraphed to Toronto on June 15th to be delivered in Halifax by July 16th.

National Association Hold Meeting

Standard Sizes of Lumber and Uniformity of Manufacture Discussed— Removal of Duty Vigorously Opposed

The 11th annual convention of the National Lumber Manufacturers' Association was held recently at Kansas City, Mo. The address of the president, Mr. E. G. Griggs, Tacoma, Wash., contained a number of interesting references to the work of the association, among them being the following:—

"One of our chief aims is to secure among the manufacturers of lumber of the United States uniformity of manufacture. I believe in some of our local associations a great deal has been done along this line. The closer application we have on these lines, the less waste, the better utilization of by-products, and the wider our markets. Our producing centers are being drawn closer together by the linking of our two coasts through the canal, and the probable permanent improvement of the great Mississippi river and its tributaries.

"I hope to see the time when a national standard size will mean the same finished size wherever it is manufactured in the United States. If this size is deviated from the consumer must pay the cost. Strong competitive conditions will, of course, modify this in a measure, but economy, conservation and profits demand it.

"I know of no more effective conservation argument than a permanent flat car stake, both for logs and lumber, and it will have to come."

"Our fight is against substitutes, and we have, by the establishment of creosote plants, so prolonged the life of our product that the argument of cement or rock is of no avail. We are true conservationists because, by prolonging the life of our timber by the use of creosote we perpetuate our lumber. At all events, we greatly prolong its life and thereby decrease the waste by rot and decay. We are educating the people to believe in a creosoted paving block, the best and most permanent paving ever laid."

Standard Patterns and Sizes

The report of the secretary referred among other things to a proposal that the association should undertake various lines of work for the benefit of the lumber industry, among which was the standardization of patterns and sizes of dressed lumber in soft woods, a suggestion not difficult of accomplishment if taken up seriously; also to work out with the box manufacturers a standard of box lumber in order that standard strength tests and sizes for boxes might be universally adopted as desired by the railroads. It was also proposed, he said, that the association undertake an exhaustive investigation of the progress made to date in the utilization of waste material both in the woods and sawmills to be made by an expert working under the direction of a committee.

Another suggestion was that the association should employ a professional forester of national reputation, to consult with and advise private owners of timber lands as to the best methods by which scientific forestry could be applied to practical logging operations in order that the timber supply might be perpetuated.

The reports presented by affiliated associations indicated that the lumber business was in a very fair shape with prices holding well in all lines, with the exception of yellow pine. Confidence in the future of business in general was expressed.

Mr. E. F. Perry, secretary of the National Wholesale Lumber Dealers' Association, in addressing the meeting said that while he had heard of over-production and consequent lowering of prices, conditions in the eastern territory showed that the present easing of prices was only temporary and not a reasonable cause for worry. The demand had fallen off somewhat, but this should not result in forcing the markets as it was only seasonable. He suggested that there should be some means of holding lumber during dull periods, so that the market would not be flooded. As far as he could see, manufacturing operations, at present were not going on any faster than consumption.

Report of Committee on Standard Sizes

The committee on standard sizes presented a report which was in part as follows:—"Naturally the different lumber producing territories had constructed patterns such as were required by the trade for the different uses, which in time developed into well established standards, and gradually extended into larger consuming territories calling for various kinds of lumber. As these different territories commenced to overlap the difficulties relative to different standards of manufacture in the same class of lumber became noticeable. Through the necessity of dealers having to keep separately the various sizes of like patterned stock, there at once developed a demand, on the part of the dealer especially, that future shipments should be of stock which would conform to that which he most largely carried on

hand. This resulted in requiring the manufacturers to produce such standard sizes of manufactured lumber for the different territories into which he shipped his lumber in competition with other kinds of lumber. As most of this lumber was used for the same purposes, there existed no sound reason for a continuance of different finishing sizes or styles of working. Naturally, many efforts have been made toward establishing a single standard of manufacture for the same class of lumber, though it be produced from several species of timber. The main difficulty in this effort became evident in trying to decide which of the standards in use was the most practical. The determination was also made difficult on account of the large amount of worked stock in the hands of both the dealer and the manufacturer, and therefore the desired progress has not been made in this direction—such as should be in keeping with the increased use of one wood over another—as, for instance, that which has occurred in the extended use of yellow pine lumber gradually entering comparatively all parts of the United States. We, however, have this result, that the standard sizes of dressed lumber used by the Yellow Pine Manufacturers' Association are best known and most generally used. Notwithstanding that those standards are most widely used and known, there today exist differences in standards used by members, of other manufacturers' associations producing the same kind of lumber—the differences, however, are comparatively few. Owing to the general use of yellow pine, its production being about fifty per cent. of all the principal woods produced in the United States, the manufacturers of Pacific coast forest products were influenced to adopt, in the main, the same dressing rules which now in practical effect apply to about sixty per cent. of the total amount of commonly used lumber manufactured. Most of the variations now exist in sizes. Consequently there should not be much difficulty in having the different associations consider modifications which would obviously show for economy in production."

The committee on resolutions presented a report which included a resolution protesting against the removal of duty on lumber entering the United States, referring particularly to the prohibition on the part of Canada against the export of logs to the United States and the imposition of an advalorem duty on dressed lumber entering Canada from the United States. The resolution also said that Canadian mills in the northwest had an advantage over American mills because the navigation laws of the United States gave foreign steamship companies a decided advantage. This resolution was carried by the association, with an amendment suggesting that the removal of the lumber duty was injurious to conservation and would result in increased waste, as southern manufacturers could not pay 24 cents freight to northern markets on low grades in competition with duty free Canadian low grades.

A resolution was also carried favoring the holding of a forest products exposition under the control of the National Lumber Manufacturers' Association. The resolution recommended the appointment of a committee of five to formulate a definite plan.

Must Raft Logs on Muskoka River

As a result of representations which have recently been made by the navigation interests on the Muskoka Lakes, an Order-in-Council was passed by the Ontario government on June 12th to regulate the driving of logs or timber of any kind on the Muskoka River, between the town of Bracebridge and Lake Muskoka. The regulations in connection with the order state that from and after July 15th, 1913, lumbermen and others driving logs or timber of any kind on the Muskoka Rivers between the town of Bracebridge and Lake Muskoka shall cause the said logs or timber to be made into rafts of not more than 100 feet in length by 100 feet in width, and such rafts shall be towed by suitable tugs in a safe and orderly manner to Muskoka Lake.

Any contravention of these regulations will render the owner of the logs or timber liable to a penalty of not less than \$100.

A conviction under these regulations shall not interfere in any way with the right of any person or party who has suffered damage to person or property by reason of such contravention, to prosecute the owner of the logs or timber or any person in his employ guilty of such contravention and to recover for the special damage sustained.

The Taylor Mill Company, Limited, P. O. Box 628, Victoria, B.C., have a lot of excellent manufacturing and business sites to offer. They have a quarter page announcement in this issue.

The Retail Dealer and His Problems

The Value of Systematic Methods in Business

Office System for Retail Lumber Yards

By G. H. Tessman, Terre Haute, Ind.

So many volumes have been written upon the subject of bookkeeping, accounting and systematizing that it might seem difficult for any one to undertake the authorship of new and improved suggestions; but on account of the greater development of the commercial world, we find that methods in use ten years ago will not meet the needs of today.

It is not my intention to leave you with the impression that the system that I will outline here is the best that may be had, probably many of you have better in your offices now, and some may be built upon a more elaborate basis, as I shall try and keep away from cost accounting, such as would cause the use of a very broad set of books and an extra amount of labor to keep them, but the system that I will introduce to you is simple, short and accurate, and at the same time, keep in mind all tracing details, so that a complete record is always at hand, nor do I contend that this system will suit each individual case according to the forms that have been provided, because, in my experience in systematizing, I find conditions in different localities that require a change in some of the forms, while some need more forms and others less. No set of fixed rules for office system and management can be laid down without varying somewhat with the nature and magnitude of the business, although the basis of the system is fundamentally the same, regardless of the number of people employed or the manner in which the work is done.

The last few years have witnessed a wonderful growth in the use of records of various kinds for the purpose of producing statistics, and the success of business today is not alone upon the basis of shrewd buying and selling, but also upon the accuracy of keeping of all records and transactions, together with proper organization and systematic conduct and management. Uniformity is needed in good system, yet it must be simple, and is very useful when you master it and sometimes ruinous when it masters you.

A great many people confuse the word bookkeeper with that of the accountant, and to give you a more clear comparison of the difference, would be as the architect is to the builder; both are essential in the building line, and so it is with systematizing; the accountant builds the best system for the particular business in order to give the required protection and yet keep in mind accuracy and simplicity. We are in the age where the owner desires periodical and concise statements of the affairs and transactions of his business, and to this end we are building the short modern methods, together with better bookkeeping. Accountancy is an abstract knowledge that cannot be transferred by lectures alone, but must be acquired by study and application with reasonable practice. In short, the secret of successful system includes a good set of records and indexes, with a good accountant to keep them.

In some of the larger offices each division, such as purchasing, advertising, sales, credits, orders, traffic, collections, accounting, stock records and correspondence, are covered by a manager for each department. However, under this system I shall assume the one manager office, with the necessary accountants and assistants under him.

We are now ready to start our system into operation, and the first duties to be performed are in the purchasing department. In no department is there need for more accurate and complete records than in the buying. The duties under this head are the keeping of buying data of past purchases and present orders, but before these orders are placed we wish to have intelligent information as to where to place them, and for this purpose we will install a card index of information. This index will be so arranged so that every article that is handled will be listed, and with the necessary information as to catalogue or circular quotations. For the circular we can use the ordinary letter file or one section of the cabinet file, but for catalogue filing we can use a bookcase or shelf, by placing a prominent number on the back of each catalogue, and reference will be noted on the information index as to catalogue number. Special quotations may be filed in the ordinary letter file, but these are generally limited as to acceptance. After we have selected from this information as to where the order will be placed, we will use one of the regular order blanks which is numbered in rotation, and the original will be sent to mill or jobber and the copy will be filed in a tickler file, which contains the numbers from 1 to 31 under the date which acceptance is expected. When the acceptance is received the order is filed away in numerical order and the acceptance is filed in the tickler under date invoice is expected, and when the invoice is received it is filed

under the date shipment is expected to arrive. If for any reason that any part of this routine misses connection from the expectancy the matter may be taken up from the information thus afforded and the shipper's attention called to the delay. The foregoing program will be followed whether the order is placed by mail or given to the salesman. The receiving of the goods comes under this department, and when the invoice is received and carefully checked and found correct it will be entered upon the car record or material received book and after the material has been checked and found correct the invoice will be entered upon the combination journal (which will be explained later). This material received book through its many column arrangement, gives you all the information covering each invoice that is desired, and is the only book that is used for accounts payable in connection with the combination journal.

The goods having been received and checked into the yard will now be entered upon the stock record and in order that this may be kept correctly, every one connected with the yard must see that the office is provided with full information as to each transaction. This record provides for the total of all purchases and all sales and the balance column will tell you the amount on hand. These records are not only intended for the present information, but may be used as a guide on future buying. This record is built upon the card index system, and you can use one card for each item or one large card for each size with columns provided for the different lengths. It is recommended that one card be used for each length, for in this way the better selling lengths can be replaced with new cards and the slower ones will not be changed. The stock record purchases are posted from the invoices after the goods have been checked into the yard and the selling records are made up from the delivery and cash sale tickets.

The material having been received, is now ready for the sales, and in this connection comes the advertisement. I will not dwell on this branch of the business, for I have found that each individual has his own ideas for advertising, and it is a hard matter to outline a system without knowing the immediate conditions. However, it is well to keep a record of the different methods used, in order to find which one of your investments in this line will bring you the best returns. Advertising is a separate study, and unless you give the matter careful attention it will prove a wasteful expenditure of money. Good advertising is profitable.

About the first thing to come under the head of selling is the making of estimates, and I have prepared a form that is intended to cover all the necessary information as to price and delivery. I am of the opinion that the old method of making a blanket bid to cover all material that is necessary for a job is about done away with and the more modern way of making the estimate with price and extension, has taken its place. This method will allow you to charge each delivery according to the estimate, and while I suppose that I will meet with opposition on this stand, I contend that it is the most logical method in order that each delivery may be charged as it leaves the yard, and in this way you have one asset to offset the other. My ideas are that in a strictly set of double entry books you must keep your assets and liabilities right up to the minute, and if you do not charge the material to the customer you will have to make some kind of a charge of it, and your only alternate debit is to contract sales, and then when the contract is completed, you can credit the contract sales with the amount and charge the whole to the customer. But this is not according to the short cut method as outlined, so from my standpoint I would not use it.

I would like to introduce a tickler file, and I would use this for every purpose that required future attention, and in the case of an estimate being made today I would not in this tickler under date of five days hence and use the follow-up system on the prospect of securing the same. This tickler would be used for collections and every purpose that required attention under any future date.

I have mentioned to you about the index file of information, and also of the circular file for prices and in this connection I would like to add the necessary files for invoices, letters, orders, receipts and special quotations, and I am sure that any of you who have used the filing cabinet system will prefer it to any other method. In addition to the above, you may have sections for estimates, contracts and shipping receipts. These cabinets may be had in any size and are equipped with the card index system and the removable bellows folders, so that in making your transfers at the end of your annual or semi-annual period, you need only to take out the folder and place the same into your transfer case and replace the cabinet drawer with

a new folder and you are ready to begin your new period with but very little work having been taken up toward this change. The card index system will be used for stock record, and also for your information index will be included in this cabinet as has been referred to and the forms explained.

Before we start in to accepting orders for our delivery system, I wish to touch upon the subject of selling material at a profit, and if you are a new beginner this will be a matter of guesswork for the first few months, but as all of you are experienced in the business, we will assume that the necessary information is at hand. The percentage of profit on the cost is the first step and the percentage of expense to the selling price is the second step. There are a great many dealers who will figure 10 per cent. profit and 15 per cent. for expense of doing business, and will sell at \$1.25 retail on the basis of \$1.00 cost, thinking they will make a net proceeds of 10 cents on each dollar, but at the end of the period when an accounting is taken they will find the earning to run .044 per cent. short of the expectations. Now, in arriving at the expense basis on your selling price, you must be careful about including carload lots that are not handled through the yard, it may be, this year you will have several carloads that will increase your total sales to a high mark and in arriving at your expense basis for the next year, it will naturally decrease the percentage, and the following year you may not have so much of this class of business, and the amount included for your expense will be insufficient to cover. If you will use the percentage basis on figuring expense, you can tell at the end of each month whether to increase or decrease the amount, according to the amount of the sales. This applies to such items that are not fixed.

I will now take up the receiving of orders for delivery, and for this purpose we will use the loading tickets only. It will be the intention to eliminate as much book work as possible, and to do this we will have to cut out the books. This loading ticket will be used for all orders, whether to be delivered or called for, and the same will be dated and numbered so at the end of the month all the loading tickets may be assembled in numerical rotation. The loading ticket will have all the information as regards the number of pieces, size, length and grade, the loader and teamster, and when the delivery ticket has been made for the same, it will be cancelled "Filled Dec. 15, 1912," and when it is assembled at the end of the month, the same will answer as an order book.

Having loaded the order, we will require the invoice or delivery ticket. This is made out as a regular invoice in triplicate form, by using the autograph register. The first copy is used for office file and posting, and the second copy will be the customer's invoice and the third for delivery receipt, and the same will be made out with complete extensions and no material will leave the yard that has not been provided with one of these tickets (whether called for or delivered), and we are quite sure that nothing will be taken away that is not charged or accounted for. This delivery ticket will carry all the necessary information with it by having a number of its own for rotation filing, the number of the order, by whom ordered, delivery directions, loader and teamster. Any further information regarding the delivery may be easily obtained by referring to the order number (loading ticket) which, as explained, is filed in numerical order. The delivery receipts are checked up each evening to see that all are signed and none are missing and filed upon a post binder, the original are used as a day book and are posted to the current monthly statement, and also filed upon a separate post binder.

The current monthly statement, referred to above, will answer the purpose of a journal and also a statement for your customer at the end of the month. The principal use of this form is to save ledger paper and save time at the end of the month in making up your statements. The posting to the ledger from this current statement will be done at the end of the month and by totals. After the month's business is closed the statements will be footed and entered upon the ledger, using the last date of purchase, statement number and amount, and are filed on a post binder in numerical order. All orders, tickets and statements are always filed face down. In the event that you have a contractor who has two or more jobs working at the same time, you will use a separate statement for each job, and when the total is entered into the ledger you will always have each job journalized for each month that the same was under construction. So far we have used no books in our selling department, and each time that we have handled a transaction the same has answered two or more purposes. The current monthly statement is made in duplicate and the copy is mailed to the customer, so that he may check each item by the copy of the delivery-invoice and in this manner he will have a copy of your books except the ledger entry.

I have no particular choice as to ledger form, but have one that has been very satisfactory wherever used. This, of course, is in the loose-leaf system. I find the balance column to be a very material aid in eliminating errors, as the amount of balance is carried out after each transaction instead of footing lines in the ordinary ledger. The account column is used to designate where each charge was delivered, as in the case of a contractor or real estate agent. I wish also to touch upon the matter of ledger indexing. I would use the 26-letter divi-

sion index and at each division would insert a form of vowel sub-divisions. Each ledger page would be numbered according to the vowel subdivision.

One of the important branches of the office is the handling of cash, and I recommend that this be under the supervision of one person. This refers to that money on hand, and not the cash registered or petty cash drawer. After the money has been balanced for the day let the same be turned over to the proper person, who shall be responsible for the amount. In referring to petty cash drawer, I would place in a separate drawer an amount necessary to meet petty expenditures, say, \$25, and at the end of every three or four days the receipts and petty bills would be taken out of this drawer and charged out through the regular channels, and the petty drawer would be reimbursed to its original amount. This will always leave an amount available for the office use, and the larger bills will be paid by cheque or voucher. With reference to cash receipts and on account, I find the autograph register equal to all occasions. This will be used in triplicate form by giving the customer copy No. 1; the second copy will be filed for the office and the third copy is the summary of all the transactions which remains in the machine for the purpose of balancing the cash for the day. These tickets will be used for each sale and the form of the ticket is so made that items sold may be listed thereon as an invoice and the same may be used as a cash receipt on account. The record at the bottom of the ticket is the only part that is recorded on the summary, and is so arranged that footings are readily obtained.

In connection with the foregoing system, we will use a book that is the key to the whole office system, viz., a combination journal, cash book and register. This is a multi-column book, with debits on the left page and credits on the right. This is kept in columnar form in order that all like accounts may be entered and carried forward in one sum when properly posted; will give you the necessary information as to each division or department of your business and what is commonly called a controlling account book. The result then is that we have a perpetual trial balance always before us. This can be used in connection with a voucher system, but as the voucher does not carry with it the simplicity that I have in mind for this system, I will not go into details covering the same. Journal postings are made to this book direct, by entering the amount under the proper debit and credit columns. The total of the monthly statements as referred to is entered in this book as a whole amount by debiting customers account and crediting sales. The amount on the summary cash slip will be entered in one amount here by debiting cash with the total and crediting sales and customers' accounts, respectively. At the end of the month we take the totals as shown by the ledger postings must correspond. Totals are never carried to the next page until the debit and credit sides of the book will balance. It is not necessary to carry a ledger for any of the accounts except accounts receivable and your general accounts, and for the latter I would use a separate or private ledger. This one great feature of this journal is the help derived by taking a trial balance, or if your trial balance footings will not agree this book will tell you in what division your error lies, for your journal footings must be right before you forward the totals and before taking off a trial balance.

This concludes the system as I have prepared it, and I wish to repeat that system is good when you master it, but ruinous when it masters you, and while I am not on the program for office management, the success of the business depends upon whether the information gained by the use of accurate records will be put to the use that is intended.

In connection with the system as outlined, it may be well to add the adding machine and typewriter; both are labor saving devices and a necessity in every office.

Chemical Pulp Duty May Not Be Serious

Official correspondence has been exchanged between the governments of Canada and the United States, through the British Embassy, in connection with the proposed provision in the United States tariff act, imposing under certain conditions a duty of \$2 a ton on chemical pulp produced from lands in Canadian provinces where there is a restriction on the export of pulpwood. No definite conclusion has yet been reached upon the question, but advices from Washington are to the effect that the United States Treasury Department does not interpret the proposed clause as likely to affect the importation of chemical pulp from the Canadian provinces, in the manner feared. The matter was discussed in the House of Commons at Ottawa on the closing day of the Session. Subsequent correspondence, it is reported, does not justify the fears which were expressed at that time.

The Thorold, Ont., Board of Trade will invite Hon. Frank Cochrane, Minister of Railways and Canals, to turn the first sod on the new Welland ship canal at Thorold. The pulp and paper manufacturers along the old Welland canal are taking the greatest interest in the new waterway, which will mean so much to them in improved transportation facilities.

3 in.-4 in. COMMON LUMBER 10 in. and 12 in.

The Latest and Most Modern Method
Price for Common Lumber

A Cost of 75 Cents per Thousand Feet Board Measure

In many sections of the country, East and West, in spite of the utmost care in sawing there accumulates a vast amount of common lumber, 3", 4" and even 6" wide, which at times is almost impossible to move without cutting the price several dollars per thousand. Most lumber manufacturers would be satisfied were it possible to obtain from their narrow width common lumber the actual cost and, in most instances, in order to move the accumulated stock quickly they are compelled to sacrifice.

By the Linderman method two 4" strips can be joined to make 8" shiplap at a cost which will not exceed 75c. per thousand feet, and a comparison of the figures between 8" shiplap and 4" common lumber at what it is sold for, adding to it the cost of joining it together by the Linderman method and the cost of milling it, leaves a net increase in price of from \$2.50 to \$4.00 per thousand. 10", 12" or even wider widths can be built up in the same manner and at the same cost per thousand, no matter whether the lumber being worked is spruce, hemlock, fir, cedar or pine.

Narrow lumber can also be joined together for rough sheathing, partition work, barn or subflooring and other purposes.

There are Eight Different Lengths of Linderman Machines Built
Ten, Twelve, Fourteen and Sixteen Feet

CANADIAN LINDERMAN COMPANY

WASTE LUMBER Converted into 8-in., n. SHIPLAP

for Obtaining a Greatly Increased
Amount of Lumber

Yields a Return of From \$4.00 to \$5.00 per Thousand

Shorts and odd lengths can be joined to narrow widths, making a composite board of any length desired up to 16'. This is accomplished by running a binding strip on the outside the full length desired and joining to it two or more pieces of miscellaneous lengths that will equal the length of the binding strip. To this can also be joined another series of short lengths so arranged that the butt end joints will not come opposite one another and to this then can be joined the second outside binding strip. Such a composite board will show tight joints not only where they are joined together on the edges but the butt ends of the boards will be tight, making a board as strong and stronger than the natural wood. Such a product, while it may not bring a price equal to a wide board of the same dimensions, will yet yield a profit of several dollars per thousand over the cost of manufacture. In this way the cuttings from the flooring machines or from the sawmill can be converted into a marketable product instead of as now being sold as kindling or sent to the burner.

Full information and particulars in detail will be gladly given and we will arrange to work samples of your own stock if you so desire.

WORKS AT:

J. E. Moore's New Mill Nearing Completion

John E. Moore, St. John, N.B., reports that the new sawmill which he is building at South Bay will be completed next month. Discussing trade conditions, Mr. Moore reports the closing down of all the St. John mills, as a result of the strike of the raftsmen and pilers. "It is impossible," he says, "to say when operations will be resumed. In the meantime, the American market has flattened out. Prices have gone off \$3 to \$4 per M., and there is no demand even at the reduction. The English market is very quiet with little active demand."

Delivering Poles by Electric Truck

The accompanying illustration shows an electric motor vehicle of 6-ton capacity recently designed and built for the Philadelphia Electric Company, which uses it in transporting telephone poles. This truck has four-wheel steer and four-wheel motor drive. The batteries are located in a compartment at the forward end of the truck. It has an overall length of 31½ feet on a 20-foot wheelbase, and by using the four-wheel steer it can be turned in a radius of 18 feet. A mileage capacity of approximately 30 miles at full load is claimed for the truck, which has a speed of 7 miles per hour on the level at full load. Without load the truck weighs 12,000 pounds, the division of this weight being 60 per cent. in front and 40 per cent. rear. Weight dis-

Electric Truck used for Delivery of Telephone Poles

tribution is equal under load. The brakes operate on all four wheels. Loading and unloading of the poles is accomplished by an electric winch located in the center of the truck and so wired that it can be controlled from switches under the seat or from either side of the truck or at the motor. This loading and unloading device makes it necessary to detail only two men with the vehicle, whereas four men have been necessary without the winch. The idle time, too, is cut by the use of this winch. Some of the poles are 90 feet long and are difficult to handle in congested sections of the city, and when added to this length is that of a two-horse team in tandem, the total overall length is sometimes 130 feet, proving a great obstruction to traffic.

Death of R. Harcourt Smith

The death recently occurred at Quebec of Mr. R. Harcourt Smith, one of the members of the firm of W. & J. Sharples, at the age of 54 years. Mr. R. Harcourt Smith was one of the most widely known and highly respected citizens of Quebec and the announcement of his death was a great shock to all who knew him. He was born in Quebec and was a son of the late R. Herbert Smith. He was educated at Lennoxville College and when quite a young man commenced to learn the timber and lumber business. He became recognized in later years as one of the greatest experts in the Quebec trade. Mr. Smith and his family recently returned from a visit to England. After his arrival he contracted a slight cold which gradually developed into pleuro-pneumonia. In addition to his connection with the firm of W. & J. Sharples, Mr. Smith was one of the first directors of the River Ouelle Pulp & Lumber Company and had always been connected with it in the capacity of treasurer.

The death occurred at Quebec city recently of Mr. R. Harcourt Smith, at the age of 54. The late Mr. R. Harcourt Smith was a junior member of the firm of John Sharples & Company. He had been ill for some months and death was the result of an attack of pleuro-pneumonia.

Mr. Wm. Anderson, a prominent lumber agent at Quebec City, dropped dead recently from heart failure. He was for many years connected with the firm of Price Bros.

The Lumber Salesman and the Dealer

Sociability in business is not the greatest essential to success, but it is a commendable quality, and when judiciously employed becomes a helpful influence in trade transactions. It serves a purpose similar to that of a lubricant upon a shaft or axle. But when too much oil is applied it "gums" the machinery and fails of its purpose. Too much sociability may have a like effect—it may "gum the game."

In no other line of business is the fraternal spirit more often exemplified than among lumbermen, in all departments of their great industry. This is a fact that is well substantiated by the friendly relations which, as a rule, exist between the salesmen of large manufacturing concerns and retail dealers in the country towns. Once an order is booked by the salesman he soon becomes a regular among the visitors most welcomed by the dealer, and with each visit, if he it not too free with the "oil," and is free enough with information regarding trade conditions generally, he acquires a firmer footing with his customer. And should he possess any ability in the "yarning" line—which most of them do—his cinch upon that dealer's trade becomes sure and certain.

The information obtained from the salesman keeps the dealer posted on the current trend of the market, and often is a great help to him in keeping up his stocks, and when a friendship becomes established between them, as often happens, it may result in a correspondence that will be beneficial to both. Sometimes it leads to greater things, as in the following instance:

A yard owner in a village in central Illinois a few years ago was called upon by a bright young representative of a big Chicago company who was covering that territory for the first time. He was somewhat of a swell, but he knew his business and started in cautiously. Presenting his card in a quiet way he said:

"Allow me. I saw your sign from the car window, Mr. Robbins, and dropped off to get acquainted."

Mr. Robbins stood with his hands in his trousers pockets leaning back against a high desk. He had turned fifty and was gray and deliberate. He wasn't the most amiable looking man the young salesman had ever addressed, but there was a twinkle in his steel-gray eyes that was somewhat reassuring. After a keen survey of his caller he slowly drew one hand from his pocket and taking the card read it as though spelling each word. Then in a very grave and dignified manner he held forth his hand, saying:

"Howdy do, Mr. Jenkins. New on the line, eh?"

"Yes, on this line. I've been looking after city trade. Like to sell you some lumber, Mr. Robbins; what do you need?"

"Hm, I need more customers than lumber, sir; business is flat; not selling a board."

Just at that moment a leather-lunged voice bawled in through a back window of the office: "Hi there, Jim, come on out here and scale out this load! Git a move on now, I'm waitin' on ye."

With a wink at the salesman the owner of the establishment dryly said: "'Jim!' that's your humble servant. That fellow is making me sound like a liar." Then he walked slowly out into the yard where a corn-fed gentleman in blue overalls was dragging a pair of horses and an undressed wagon into position to take on a load of lumber.

"Say, Bill," he said, with a peculiar hitch at one corner of his mouth, "you forgot your manners. There're city folks present and you're giving me a shamed face. I just told the gentleman I was not selling a board, and here you come in the nick 'o time to give me dead away. You ought to feel ashamed of yourself, sir."

Bill looked around and saw the salesman grinning in the office doorway. "Hello, kid!" he yelled. "Grab hold here 'n give us a lift!"

"Kid" surprised them. Shucking his jacket and spitting on his hands Mr. Jenkins turned a neat trick by shoving down the lumber while Bill built the load, after which he started in to dig the splinters out of his hands. His reward was a bang on the back from Bill that unhooked his backbone in several places and the stertorian acknowledgement that he was a "Bully boy with a glass eye!"

The day was won for Jenkins. He was "cheek by jowl" with Bill instantly, and—paregorically speaking—had Robbins by the ear. He was invited to dine with the dealer and his family. This led to an introduction to the lumberman's daughter and made him forget what he had come for. He woke up in time to get the order, however, and a pressing invitation to "come again," which he was not slow in accepting. That was the beginning of it all—the business and the romance. He took to dropping off the cars at Robbins' yard with such frequency that the sales manager of his company wanted to know why he was working an unproductive territory so pertinaciously. He "fessed up," and the manager "brushed by" humming. "When the Robins Nest Again." And so it came to pass—"Jenkins-Robbins" at the head of the hymeneal column in the lumber paper, and not very long thereafter Jenkins got in line as a retailer on his own hook.

Such an unforeseen and blissful outcome of drumming up trade

in the lumber business is not vouchsafed to every salesman who drops off a car at a country lumber yard—they can't all find the right yard—but the way is always open and the opportunities for business success in this field are numerous. When the dealer and the salesman get together, and the right feeling exists, they are sure to benefit each other in more than a business way.

The coming together of the retailer dealer and the salesman on a friendly basis is more often brought about through the retailers' association meetings than in any other way, and the acquaintances so often formed at these gatherings in many cases become cemented into bonds of lasting friendship which makes for mutual advancement in business and society—Lumber World Review.

Inspection of Rejected Lumber by Salesmen

You know how one thing suggests another. If I should sit down in a corner I should expect to become as dry as a farrow cow. If I were to be hanged for running dry I should be obliged to tell them to bring on the rope. But when I associate with you active and wide-awake lumbermen, you simply pound ideas, and suggestions of ideas, into my head. When the lumberman quoted in a preceding article spoke about rejected lumber being passed on by the salesman, or the house by which he is employed, who sold it, what I would call a full-fledged idea bounced out.

What would a salesman say about this? was the question suggested.

The third night after I had the pleasure of eating at this lumberman's home it happened (if anything ever does happen, which I very much doubt) that at the hotel at which I stopped was the salesman who makes the territory for the company that shipped the flooring. I had met him several times, therefore I felt that I was fairly well acquainted with him. It doesn't take long for the men on the road who travel together, eat together and tell stories together to become acquainted. We butt right in, and the first we know we are boon companions, I may say. I wish that humanity at large were as jolly and companionable in their social relations as the travelling salesmen are.

Following supper, when we had pulled a couple of chairs out on the sidewalk, and were enjoying cigars that the salesman had paid for, I said to him, "It was a pretty scaly car of flooring that your company shipped to So-and-So, at ———."

"It was?" he asked.

"Surely it was," I replied.

"How do you know?"

"Because I saw it."

Then I related to him the circumstances, and he said it was too bad. "But such mistakes will occur," he said. "Mistakes will occur in the best of families. Our folks wouldn't ship such stuff intentionally any more than Mr. ——— would misrepresent the quality intentionally."

I know his company, and I told him I believed him. "We are a unit as to that; but here is the proposition that I want to put up to you. You may be asked to look over this lumber. You want to be honest with your house, and you want to retain the good will of your customer. Your house pays your salary; this dealer probably buys several cars of lumber from you every year; the amount of lumber you sell has something to do with the size of your salary. Not many of us can treat a question judicially—with perfect fairness; but in this matter on which side would your interest lie; and would you act in the direction of your interests? I say 'you,' but I am not making a personal matter of it. On which side would the interests of the salesman generally lie?"

"You would make a good lawyer," said he, and though I could see no connection between the two, I told him that it came near breaking my heart that I could not study law, but that a cog slipped and disarranged the whole machinery. This was not a question of law, however, I said to him, but a question of moral and business ethics.

He took several whiffs. "It would be easy to corner a man on such a proposition as that," he said. "In all business transactions there are conflicting interests that must be considered."

"If you think I would make a good lawyer, I will play that I am one now, and ask you to answer my question. Whom would you play as a favorite, your house, or your customer?"

"Between you and me, seeing it will go no farther, I have customers whom I would favor—a little, not much, but a little." And seeming to have got his second wind, he continued, "And I think it would be doing a favor to my house to favor him. There is ———, out here at ———. Last month I sold him three cars of lumber. In a year I sell him maybe sixteen cars. My house is pleased with his trade. It wants his trade. If a slight difference of opinion should arise regarding the quality of the lumber he received, and I was asked to pass on the matter, I think it might be justifiable to smooth it over a little in favor of the customer, rather than to hold him right down to cold facts, for if the latter was done it might be a

means of severing business relations between him and the house."

"And you would do this unbeknown to the house, having in view its interests and your interests?"

"Yes, I would," he said.

"But wouldn't your house make the same concessions? Wouldn't it bend a little to hold the trade of the customer?"

"I don't know; the old man is particular about such things."

As Viewed by the Wholesale Dealer

Going to my room I asked Little Dutchie to place this conversation on paper, and it was slipped into an envelope and stowed away in my grip, expecting when the occasion presented itself to learn what the man at the other end of the rope thought about it, and the opportunity came when talking with a Kansas City wholesale dealer. "O, I don't know about that," he began in a way that would indicate he had very little interest in it. "We give our salesmen considerable latitude, believing they know what to do when on the ground better than we do sitting in the office."

"Then you would approve of the salesman making good in his own way shortages or grade which might reflect on your company, rather than having a chance to correct them yourself, would you?"

"No, sir, we would not," and now he was interested. "We would want the privilege of letting the customer know that the company stands ready to make good anything that was wrong in a shipment; and we would want perfect frankness on part of the salesman."

"Do you think that in order to stand in with a customer a salesman ever favors him when sent to inspect a shipment that is not satisfactory?"

"I don't know. A salesman never likes to lose a good customer, and it might be human nature, if it was not keyed up to a high pitch as to what is right and wrong, for him to favor it. I should not want to think that one of our salesmen would do it, however."—Met L. Saley, in *The American Lumberman*.

Uneven Thickness of Lumber

We read much about conservation these days, but, judging from the condition of lumber as it comes from the jobbers, not much attention is given this subject at the mills. It seems, with our improved band saws and advanced experience, that more care should be taken in the sawing of logs into lumber, to make boards run even in thickness.

The saw mill man has a great opportunity to conserve, in the line of sawing and piling his lumber. Much lumber seems to be greatly damaged in not being properly piled. Concrete or other foundations, that would be firm and stay level, should be used, and should be made just as level as a foundation for a building. Then three stickers should be used, the center one being narrow and not placed directly over the one below. With this plan one side of the board only would be closed from the air, and that just the width of the sticker. When lumber is taken down, after standing on a foundation as described, don't you think we would have some nice, straight stock? Which lot would you consider buying, one piled like this or one piled any old way. We read about the great band saws and their great daily cutting capacity, but have yet to read of the lumberman advertising and guaranteeing his lumber to be even in thickness. And why not? If the sawyer can set his gauge and saw one board even, why can't he saw a thousand boards the same way? Is it because he feeds the logs just a little bit too fast? Is it because he lets that saw run just a "big" little bit too long? It is because he doesn't know when his saw begins to beg for a drink of fresh water, in the way of being relieved by another saw? Is it because he fails to keep his machine in proper shape? Is it because the owner wants the quantity, regardless of quality?

The waste caused by too thin lumber is more than, or equal to, all the other defects in it. It has gotten so the manufacturer has to plane what is known as 6/4, or 1½-in. lumber, down to 1¾ in. full, and then he has thin lumber. Now, if lumber came to us 1 9-16-in. in the rough, we could surface on two sides and finish 1½-in. scant; 8/4, or 2-in. lumber, often varies ¾-in. in thickness.

I invite fair criticism, and would like to have saw mill men explain why lumber can't be sawed even in thickness, thus stopping the enormous waste from this one cause.—The Wood-Worker, Indianapolis.

Prof. R. B. Miller, M.F., of the Forestry Department of the University of New Brunswick, visited Toronto recently and called upon the Canada Lumberman. Prof. Miller was then on his way to Frederickton after paying a visit to his home in Indiana. He will begin work in July upon the collection of forestry information in New Brunswick for the C. P. R. Three of his students will also be engaged in this work.

W. J. Hetherington, of the Wm. Laking Lumber Company, Toronto, was recently appointed one of the directors of the National Hardwood Lumber Association, at its annual meeting at Chicago.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Wanted

100,000 feet 1-in. Dry Cull Hardwood, Maple, Beech, Birch or Elm. Wilson Lumber Co., Ltd., Toronto, Ont. 13

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Wanted to Buy

Pine, Spruce, Hemlock, Basswood, Common and better, in stock of 5/8 inches, 1 inch and 3 inches. Apply J. P. Abel-Fortin & Co., Maisonneuve, Montreal, Que. 13

Wanted

Two million feet Maple, also quantity of Birch. Shipments during Fall and coming Winter. Address Seaman, Kent Co., Ltd., Meaford, Ont. 11-22

Wanted to Buy

Pine, spruce, hemlock, railway ties, common and better, and cull basswood and birch. M. Brennan & Sons Mfg. Co., Limited, Hamilton, Ont. 8-13

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.
Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.
Want 5 cars 4 1/2 in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

Wanted—Cedar Telegraph Poles

1000 poles, 25 ft. x 6-in. tops.
500 poles, 25 ft. x 7-in. tops.
1000 poles, 30 ft. x 7-in. tops.
1000 poles, 35 ft. x 7-in. tops.
400 poles, 40 ft. x 7-in. tops.

Quote price and quantity for sale, also delivery date.

Wanted

Birch logs, 16-in. and up in diameter. Buffalo Vencer Company, Buffalo, N.Y. 13

Common Elm

We are wanting from 50,000 to 75,000 feet of 1-in. No. 2 and No. 3 Common Elm. Buffalo Hardwood Lumber Company, Buffalo, N.Y. 13

Wanted Hardwood Lumber

Entire season's sawing or less; elm, ash, basswood, maple, beech and birch. All grades including the low end. Will ship promptly and pay cash. Write immediately, with full particulars and prices. Box 813, Canada Lumberman, Toronto, Ont. 12-13

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Wanted to Buy

We are in the market to buy the following lumber:
1 carload 1 1/2-in., 1s and 2s, dry quartered Rock Maple, 5-in. and up wide, 8/16 ft. long.
1 carload Rock Elm.
Also Hickory squares, as follows:
100 gross 26-in. x 1 1/2-in. first growth.
1 car 26-in. x 1 1/2-in. second growth.
1 car 26-in. x 1 5/8 x 1 5/8-in. sec. growth.
5 cars plain white Oak, various dimensions, 6-in. and up wide.
2 cars Rock Maple, various dimensions, 6-in. and up, average 9-in.
Rock Maple logs, 20 to 23-in. diameter at small end.
Rock Maple logs, 24 to 30-in. diameter at small end.
White Ash logs, 10 to 18-in. diameter at small end.
State best prices net—cash. Delivery to be made as much as possible this season, balance next. Apply P. O. Box No. 1595, Montreal, Que. 13

Trustees' Sale of Valuable Timber Limits

The undersigned are authorized to call for tenders for the following timber limits situate in Block A, Upper Ottawa, Province of Quebec. These will be sold en bloc in two parcels.

Parcel Number 1, (Season 1913 and 1914).
Limit 611 19 sq. miles River Ottawa, Grand Lake.
Limit 676, 25 sq. miles, S 1/2 16/4 Range, Block A.
Limit 677, 17 1/2 sq. miles, 14/3 Range, Block A.
Limit 678, 12 1/2 sq. miles, S 1/2 of N 1/2 16/4 Range Block A.
Limit 679, 12 sq. miles, 16/3 Range Block A.
Limit 680, 15 1/2 sq. miles, 15/3 Range Block A.
Limit 681, 25 sq. miles, S 1/2 of 17/5 Range Block A.
Limit 682, 25 sq. miles, N 1/2 of 17/5 Range Block A.
Limit 696, 25 sq. miles, N 1/2 of 17/4 Range Block A.
Limit 683, 6 3/4 sq. miles, S.E. corner of 1/2 S. No. 15/4.
Total, 185 square miles.
Parcel Number 2.
Limits 633 and 634, 50 sq. miles, Lot 8, Range 4, Block A.

The limits described in both Parcels are all surveyed and easy of access. They comprise some of the best pine and pulp-wood areas in the province.

Tenders in writing for the purchase en bloc of each parcel separately will be received by the undersigned Trustees at their office, Victoria Chambers, Ottawa, up to 12 o'clock noon of Monday, the 21st day of July next.

An accepted cheque for 10 per cent. of the price offered should accompany each tender. If tender accepted the balance of the purchase price shall be paid in equal installments at one, three and six months thereafter with interest at the rate of 5 per cent per annum.

For further particulars apply to the Royal Trust Company (Ottawa Branch), or to Code & Burritt, solicitors, Carleton Chambers, Ottawa.

Dated this 16th day of May, A.D. 1913.

The Royal Trust Company,

Trustees for Sale.

factory or real estate. I bring buyers and sellers together. No matter where located if you want to buy or sell or exchange any kind of business or property anywhere address Frank P. Cleveland, 1479 Adams Express Building, Chicago, Illinois. Established 1881. 9-t.f.

Sawmill For Sale

On Georgian Bay, near Little Current, close to north shore; practically new, well built and equipped with shingle machinery; over one mile of water front, loading dock and sheltered booming ground; plenty of timber available locally or can be rafted in from north shore or Georgian Bay. Good opening for retail store in connection. This is a splendid chance for millman with small capital; price right. Good reason for selling. Great Lakes Lumber Co., Ltd., Owen Sound, Ont. 5-T.F.

For Sale

On Georgian Bay, saw mill in first class condition, with everything complete. Engine 75 h.p. Boiler 110 h.p. Sawing capacity 20,000 feet to 30,000 feet per day. Also including booms and chains. Good stable and office and everything complete. Shipping facilities by both rail and water. Size of mill site 40 rods by 5 acre water lot, with 4 acres of land. Owner retiring from business reason for selling. Address all enquiries to 201 Campbell Avenue, Toronto, Ont. 9-14

Tenders for Pulpwood Limit

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including Friday, the 15th day of August next, for the right to cut pulpwood on a certain area tributary to the Lake of the Woods, in the District of Kenora.

Tenderers shall state the amount they are prepared to pay as bonus in addition to dues of .40c. per cord for spruce, and .20c. per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill on or near the area referred to.

Such tendere shall be required to erect a mill or mills on or near the territory, or in such place as shall be approved by the Lieutenant-Governor in Council, and to manufacture the wood into paper in the Dominion of Canada.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario for ten per cent. of the amount of their tender; to be forfeited in the event of their not entering into an agreement to carry out conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. Hearst,

Minister of Lands, Forests and Mines.
Toronto, Ontario,

Timber Limit in Province of Alberta, tributary to Saskatchewan River; small area; conveniently situated. Estimate, recent cruise, about eighty million feet, spruce and pine. For price and full particulars, apply Box 820, Canada Lumberman, Toronto, Ont. 13-16

The Use of Wood Waste

Recent experiments demonstrate the complete practicability of utilizing wood waste from lumbering and sawmill or other wood-working industries in the manufacture of paper pulp. Where the wood is resinous in character, it has been demonstrated that, in the case of certain pines and firs, by-products of great value may, in addition to paper pulp, be secured from this source, in the form of turpentine, rosin oils, pine oils, creosote, charcoal, wood alcohol, etc.

A cord of waste wood costing from \$2 to \$4 delivered at the works, may yield products worth nearly fifty dollars. The waste material so utilized comes from the wood left in the forest from lumbering, dead and fallen timber, stumps of cut-over lands, and slabs and edgings from the mills. Pine and fir stumps have been profitably utilized in this connection, especially where the removal of stumps is desirable in order that the land may be devoted to farming purposes.

Under the usual methods of utilization, not less than 60 per cent. of the volume of the tree as it stands in the woods is wast-

ed in converting it into lumber. This waste material is now becoming recognized as a potential source of great revenue, through the establishment of properly located plants for the manufacture of some or all of the above by-products. This tendency will become increasingly strong with the inevitable decrease in the extent of virgin forests.

Won't Let It Occur Again

I don't know that we have made any particular discovery, says a correspondent, but we have found that a piece of waste, partly soaked with castor oil from use in applying the oil to a belt, and later used to wipe off some kerosene from the set-works on the mill carriage, had developed a degree of heat uncomfortable to the hand, after lying on the running board of the carriage over night. As I found it quite early in the morning, it had no chance to have been tampered with, and it was too hot to hold with the fingers. Perhaps that is the combination we used to write so much about, and no

Review of Current Trade Conditions

Ontario

No appreciable alteration has been noticeable in Ontario lumber market conditions during the last two weeks and the same cautious attitude that has been prevalent for some time is still shown by purchasers of lumber. Although the money market is said to be easier, wholesalers report that they do not find much improvement in their collections and that many of their customers, who have long been accustomed to taking their cash discounts, are giving notes and in some cases renewing them. Conditions in the west, where almost any interest will gladly be paid by borrowers, are without doubt largely responsible for the shortness of money in Ontario, so many lumber buyers here having large accounts outstanding in the west. An improvement seems to have taken place in the labor troubles, most of the dissatisfied workmen having come to terms with the employers, so that no further delay to building operations is expected from this source. The recent delay has not however, been altogether a catastrophe as many builders, at the time the strike occurred, were very much pushed to obtain money to carry on their operations and the cessation of work for a few weeks has given them time to harvest their resources.

The market in the middle and higher grades of white pine remains particularly inactive, while the lower grades have not shown much change. Hemlock is still in very fair demand and desirable parcels of spruce are also fairly easy of disposal.

Hardwoods have been considerably easier the last two weeks, the cessation of building activities no doubt being the chief contributing factor in this respect.

The consensus of opinion appears to be that with good weather for the next month or so and normal conditions, a generous improvement may be expected in the lumber business generally.

Exporters of board pine are experiencing a very unsatisfactory trade situation. The demand for board pine in the Old Country has fallen greatly during the past two months and Canadian exporters have put their timber into the water, rather than send it over at the present time. Siberian pine is selling at such prices in England to-day as to put Canadian timber practically out of the market. White pine trade in Ontario in general is very dull. Stocks of the high grade are scarcely moving at all as the demand is quite dormant. The demand from the United States has also fallen off, no doubt on account of the tariff agitation and tight money. Reports from a number of the important Ontario firms all agree that high grade white pine can scarcely be sold to-day. Nobody appears to be getting former prices. There is no object in cutting prices as the poor trade does not seem to be a matter of prices at all. Factories appear to be importing a great deal of Idaho pine. Cutting up grades of Canadian pine are very quiet. One important wholesaler in Toronto reports that good sidings in all lines are \$10 a thousand off in Ottawa to-day as compared with last year and cannot be sold even at that figure. Idaho pine is coming in at lower prices than the Canadian cutting up grades can be furnished for. It affords a greater range of widths and the quality appears to be satisfactory, although there is a larger amount of pitch running through it than through Canadian stock. The Idaho pine is practically all one and a half and two-inch. It is used largely for finishing and for making doors and sash.

Spruce and hemlock have been moving well and their prices are approaching those of white pine.

Reports from the Tonawandas state that receipts of lumber are brisk, but actual business is quiet. Building operations continue on a fairly large scale and crop reports are good, so that the outlook is fairly encouraging. The most unsatisfactory feature at present is the uncertainty as to the tariff.

Eastern Canada

A strike at the St. John mills has resulted in all of them closing down. This happened on June 13th. Raftsmen, pondsmen and pilers are all asking for an advance of 25c a day and weekly pay instead of fortnightly. Prices for the English market continue unchanged. Practically all the large mills sawing English deals have sold their output for the season. Present prices are about \$16.50 per M. for specifications running 50 per cent. 7 and 8 x 3 inch, balance 9 inch and up, to average 14 to 14½ lineal feet. 3 x 4 and 3 x 5 inch are bringing \$14, and 3 x 6 \$14.50. Ends are selling at about \$12.50. Freight to London by liners are easy at 40s. The tendency of ocean freights seems to be downwards. The American market has eased off considerably during the last three weeks. At the beginning of the season the outlook was encouraging. Reports from New York city

report that building operations have practically stopped. New York and New England yards are buying only on a hand-to-mouth basis. Narrow random is selling at from \$21 to \$23.50, delivered New York, with about \$24 for a good broad specification, averaging 17 to 18 feet. Lath are also weaker and are selling at about 75c per M. less than three weeks ago. On the wharf at St. John they are now worth about \$2.75. Large quantities have been moved during the last three weeks.

Local trade at St. John is less active, although factories are fairly busy. Refuse boards, deals and scantlings are selling at about \$11 at the mill. Hemlock boards are scarce and are bringing about \$18, planed on one side.

No important change is reported in trade conditions from Montreal during the past fortnight. It is noticeable, however, that wholesalers and retailers are doing business in a rather more conservative manner than formerly. The volume of business in progress is fair, but it seems to be entirely for immediate requirements. Some wholesalers show an inclination to sell only upon prompt payment. Retailers report a moderate decrease in the volume of trade, although prices are steady. The trade in dimension timber is quiet. Shipments to the Old Country are extensive, as ocean freight rates are now more favorable than they were earlier in the season. Ground wood pulp is quiet, although manufacturers are looking forward to some improvement. There is a strong demand for sulphite. In England, easy bleaching has recently advanced \$1.10 and it is said that 60 per cent. of the European production for next year is sold. A slightly easier demand is reported for newsprint.

The lath market at Boston is more accurate, with 1½-inch selling at about \$4.40 and 1½-inch at \$4.25. Some cargo lath have been sold at \$4.10.

United States

During the last fortnight no important improvement has been shown in the lumber trade of the United States. The present demand is practically on a consumption basis and is expected to continue in this manner well into July, if not into August. The uncertainty of the money supply and the loan market are important factors in producing these conditions. The railroad demand is extremely light. The building business alone is keeping the lumber trade from stagnation. This factor is causing a steady demand for retail stocks. Indications are for good crops, but it is too early to forecast with any certainty the effect of the crops on rural trade.

The market for northern pine is firm and most manufacturers are satisfied with the outlook. The fine weather of late has enabled manufacturers to get their stocks into good shipping condition. The demand for high grade and low grade northern pine is steady and prices are firm. Low grade stocks are in good demand by the wood-working business at great lake points. Recent reports indicate that no concessions on white pine are likely, as the stocks are in strong financial hands. In the Saginaw Valley and Georgian Bay district, trade is quiet. Norway pine is reported to have dropped about \$1. Shipments of lumber from Lake Superior for May were good. Over seventy-seven million feet passed down the Soo canal during that month.

The hemlock market continues very firm. Stocks of dry hemlock are scarce and prices are steady. Fairly good assortments are being secured at Buffalo and the Tonawandas, but supplies are not too plentiful and stiff prices are continuing. A satisfactory demand for hemlock is reported from New York, with prices steady. The supply at Pittsburg is steady and the demand is fair, so that prices are unchanged.

The hardwood trade in the United States is quieter than usual, but improvement is expected after July. Stocks at the mills are said to be rather limited and manufacturers are confident that prices will remain steady. Speculative buying has been absent during the last month.

Spruce orders are plentiful in West Virginia and prices are steady. The demand for spruce at Pittsburg is accurate. Eastern consumption is on a large scale and dry stocks are small. At Boston the best price is about \$25, although some manufacturers are asking \$25.50. The demand for random is well maintained. Matched spruce boards are steady at \$26. Plain boards are offered freely at \$23.50 to \$24.

Great Britain

Very encouraging indications continue to be received in connection with general trade conditions in Great Britain. The Board of Trade reports for the month of May show that imports increased eleven and one quarter per cent., while exports increased thirteen

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

A. F. HOLDEN, Pres. F. H. GOFF, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

per cent. During the first five months of the year the total increase in imports amounted in value to £17,208,000, or five and three-eighths per cent. During the same period the increase in imports was valued at £23,870,000, or twelve and one-half per cent. Some of these advances are admittedly due to higher prices and other similar factors, but this cannot account for more than the small percentage of the actual increase. The imports of wood goods during the first five months of the year showed an increase of 200,000 loads of sawn wood. The total value of the wood goods landed during the first five months was over a million pounds.

In the Metropolitan district the lumber business is not brisk, but steady progress is being made both in spot and future selling. The tone of the trade is quite cheerful. Some of the larger importing houses have placed the bulk of their purchases and are awaiting contentedly any favorable turn of events. The price levels are well maintained, with perhaps the exception of lower quality Riga goods. Deliveries at London docks for the week ending June 7th amounted to 6,540 standards as compared with 699 during the corresponding week of last year, when the deliveries were very small on account of strike troubles.

Reports from Liverpool state that the lumber trade continues on a quiet basis in nearly every branch of the softwood business. A fair

amount of business is being transacted however. Buyers appear to hesitate about committing themselves for anything beyond present requirements. There are no indications of a drop in the freight market. Spruce deals are as firm as ever, so far as contracts for future delivery are concerned. Offerings of spruce deals are light as a result of the wood demand from the United States and also from local markets. Canadian pine deals are quiet. There is not much demand for deals, boards, etc., as the high prices are reducing the volume of consumption. Those who have been extensive buyers in the past are looking for substitutes in United States woods. Stocks of sawn pitch pine timber at Liverpool and Manchester are very large and must be reduced considerably before the market assumes a healthy tone. Spruce at Manchester is going into consumer's hands at firm figures, the cargoes on quay being practically all sold.

Arrivals at the Clyde from Montreal during the present season have been unusually light, and are made up almost entirely of contract goods, chiefly third and fourth pine deals and birch logs. The stocks on hand of Canadian woods, though light, appear to be sufficient for the probable demands for some months to come. Pine has reached such a high price that many buyers are using cheaper substitutes, with the result that the consumption of Canadian pine is becoming less every year.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Trade News—Mills Closed by Strike

St. John, N.B., June 23rd; (Special to the Canada Lumberman):—All the mills at the Port of St. John have been idle since the night of Friday, June 13, the cause for which was that the raftsmen, who deliver the logs to mill ponds, the pondsmen who place them on chains for the mill and otherwise care for logs on ponds at mills, and also the pilers, who pile the sawn lumber, demanded of the operators an advance in wages of 25c per day, and to be paid weekly instead of fortnightly as has been the case for many years. The owners of the mills, after giving the matter very careful consideration, found that it would be impossible for them to grant any further increases in wages, and so advised the operatives who were demanding it. These men then refused to continue at the present scale and thus the mills are idle and all the owners at this port say the mills will remain so until the men agree to go back at the present scale. During the past eight or nine years wages have been advanced by the mill owners 30 per cent., the raftsmen and pondsmen receiving at present \$2.50 per day of nine hours, and the pilers \$2.40 per day of same length. The quality of service given by the operatives is not nearly so good as in past years, causing the mills to lower their daily output from 10 to 15 per cent. The men are also more or less careless in their work, so it is felt by the owners that they have very just grounds for refusing any further advances.

Prices for wood goods on the English market remain as firm as at previous reports. Of course, as we stated before, really all the mills who are sawing English deals have sold their output for the season, and any advance which might take place later would not be very beneficial to these mills. The prices for English deals are at present about \$16.50 per M. for specifications running 50 per cent. 7 and 8 x 3, balance 9 and up, to average 14 to 14½ feet lineal. 3 x 4 and 3 x 5 are at \$14. 3 x 6 at \$14.50. Ends about \$12.50. Fourth quality deal \$14 to \$14.50. Freights to London by liners are easy at 40 shillings. Full cargo deal steamers for Bay ports have been fixed at about 50 shillings, the tendency of ocean freights seem to be downward. W. Malcolm Mackay is loading three steamers for Great Britain at present all with English deal.

American Market Weaker

The American market for wood goods has weakened very fast during the last three weeks. The outlook at the beginning of the season was very encouraging, and it was felt that conditions warranted a further advance, but instead of this, prices are declining. In fact lumber is selling hard, both in New England and New York. Practically all building work has stopped in New York City, and there is no sign of any changes at hand. The cause for this seems hard to find, outside of the financial stringency which is prevailing practically all over the continent. Money seems to be all tied up in the hands of the bankers, who are holding it for fall moving of crops. Of course, when the builders cannot get money, it is impossible to go ahead and plan. They are forced to abandon any further work, and this state of affairs must go on until the people who have the money will place it on the market. The yards, both in New England and New York are buying only from hand to mouth. No en-

quiries are coming here as was the case in the early season. The shortage in the cut of logs seems to have no beneficial effect so far as can be seen at present with the American market. Prices for narrow random run from \$21 to \$23.50, delivered New York, with about \$24 for a good broad specification and long average, say 17 to 18 feet, the market calling for practically all plank.

Lath Decline About 75 Cents

Lath, which had reached a very high price, are also weakening very fast and are now about 75c per M. lower than sales of three weeks ago. The prices for lath on wharves at St. John is \$2.75. The stocks are not as heavy as they were about three weeks ago, large quantities having been shipped out. At present there are about 15,000,000 at the different mills. North Carolina pine lath seem to be coming into New York for the first time, and although a very much inferior lath selling at about \$1.50 per M. less than ours, people are buying them because of the saving in price. Trade in the local market is not so strong as early in season, although the factories report plenty of work, but are using more finished lumber than rough stocks. Prices for refuse lumber of all kinds remains firm, and will continue so. In fact should the mills remain idle for a month, the builders will find it hard to get any stock for local work. Of course, they can bring it in from outside points and thereby relieve the situation. Refuse boards, deals and scantlings are selling for about \$11 at the mills.

Hemlock Boards Continue Firm

Hemlock boards are exceptionally scarce and are bringing record prices, the highest ever received here, the price being about \$18 planed on one side.

Merchantable spruce 2 x 4 in., 2 x 6 in. and 2 x 7 in. random lengths, bring about \$16 at the mills for local work, with 2 x 8 in. \$18 and 2 x 10 in. about \$20 to \$22 per M.

Stocks of pine are fairly heavy and are not in the same position as spruce, buyers being very scarce. Very little West India pine business is being done from St. John, and very few inquiries are coming forward for future business.

Cedar shingles remain in a very firm position and stocks are very low, all low grade shingles being taken about as fast as sawn.

About all the old logs which were wintered over had been sawn up previous to the strike. The new logs have been coming into booms at Fredericton very freely during the past three weeks. The jam which occurred in the Upper St. John at Priestly Rapids, about five miles below Seven Islands, was broken up by the last heavy rain and practically all of the six million of logs have come out and down river. All the operators who got out of brooks into the main St. John are now in safe waters and the logs which were left behind in brooks would not total over six million; the drive for St. John contained somewhere in the neighborhood of sixty-five million, and it is understood that practically all these logs will reach booms before fall.

Conservative Trade Conditions at Montreal

Montreal, June 24th; (Special to the Canada Lumberman):—Although trade conditions have not materially changed since the last report, inquiries show an increasing tendency on the part of whole-

DRY SPRUCE BOARDS

WE wish to inform our customers and friends that we have on hand in our Sayabec yard about 22 million feet of our 1912 late summer and autumn sawing. Is now dry and ready for prompt shipment.

¶ We have our usual full assortment of widths, thicknesses and grades and are now prepared to accept orders for May, June and July shipments.

¶ Our Sayabec Dressing Mills are of large capacity and produce Fenderson's "Silk Finish."

Yours truly,

John Fenderson & Co.

Incorporated

salers and retailers to adopt a strictly conservative policy. A fair amount of business is passing, but there is evidence that it is for immediate requirements, and in some instances wholesalers are disinclined to sell except upon a basis which will involve prompt payments. There is in fact, a halt upon the expansion which has characterized the market for so long a period. Some retailers state that they are still very busy, but generally there is a slackening off, with, however, a maintenance of prices.

Business in dimension timber is slow, pending the giving out of many contracts, some of which are held up by monetary considerations.

A large amount of lumber and timber is being shipped to Great Britain. At the opening of navigation exports were very poor owing to the advance in freight rates, but on a reduction being made, the shipments went forward at a good rate.

The ground wood pulp market remains quiet, but there is a distinctly more hopeful feeling, owing to the high water conditions in the United States being over. The outlook is favorable for better quotations in the near future.

Sulphite is again strong. The latest advices from England report a rise of a dollar per ton for easy bleaching, and it also stated that 60 per cent. of the European production for next year is sold.

News print is a little easier.

G. A. Grier & Son, Limited, Montreal, who have a mill at Lacchute, P.Q., state that their cut will be larger than in 1912. The drive this year was later than usual, owing to the lack of rain.

Ottawa Valley News—Trade Continues Quiet

Ottawa, June 24th (Special to the Canada Lumberman):—The tightness of money and the contemplated United States tariff changes which will affect lumber and lumber products are still preventing trade from being as brisk as lumbermen here would like. Another factor too, that is interfering with the export trade to England is the difficulty in getting ships to take lumber. Since the post office department made new arrangements with the steamship companies travelling between Montreal and Liverpool and other British ports they have been cutting down their stay in the port of Montreal so that they could handle the mail matter according to contracts made with the government. The new arrangement calls for at least three mail boats to leave Canadian ports weekly and three from British ports every week. The business is divided for the present, among the White Star Dominion, the Allan and the Canadian Pacific lines. Tramp steamers are not easy to get. In spite of the difficulty to get boats for England there is a fairly good demand for Canadian lumber from the Old Country.

For some time past trade with the Argentine Republic has been rather quiet. Exporters now say that there is an indication of better things if the number of enquiries received lately may be taken as a criterion.

Reports which were circulated in the local newspapers to the effect that the water in the Ottawa River is lower at present than it has been for some time, consequently causing logs to become hung up in the bush appear to be rather wide of the mark. To be exact, the Ottawa River is not at all at low water, but is a good deal higher than it has been for several years past at the same period of the year. There are a few tributary streams to the Ottawa that are low, but it is only in a few isolated cases that inconvenience as a result has been felt.

Pulp Beaters On Strike at Booth Mill

Practically all the pulp beaters employed in the pulp mills of J. R. Booth went out on strike last week after a dispute over wages. Until recently the men worked in two shifts of 11 and 13 hours and were paid at the rate of 19 cents per hour. When the company instituted the three shift system, of eight hours for each shift the men were offered 22½ cents per hour or \$1.80 per day. This the men claimed was not enough and asked for \$2, but were told they were working four hours less each day and that by the new system they were getting an increase in pay. This explanation would not satisfy so a strike was called by the men and they are still out. Mr. Booth says he is paying higher wages than are paid in most mills and will have no difficulty in filling the positions made vacant by the strikers.

Freight Rate Enquiry In Progress

Once again the western freight rates enquiry is engaging the attention of the Railway Commission and, if the predictions of those in close touch may be taken for anything the sequel will be a reduction in the freight rates on the railroads in the west with a slight increase in those in the east to even up the discrimination which shippers in the west claim to exist in favor of shippers in the east.

The inquiry is still going on and is likely to last all this week. It was before the commission five out of the seven days last week. There is already a mass of evidence put in by both the railways and the parties, including the Dominion government, responsible for the enquiry. Naturally, whatever alterations are made in the freight

rates by the railway companies it is obvious that lumbermen will be affected one way or the other. The chief regret the C. P. R., officials have so far expressed is that they are not allowed to charge the same rates as American roads, where it is claimed the rates are considerably higher than in Canada.

Some of the most interesting figures of comparative rates from the viewpoint of lumbermen and manufacturers of lumber products were those presented by W. B. Lanigan, assistant freight traffic manager of the C. P. R. He explained that this company shipped out of Winnipeg last year 13 car loads of paper boxes, the freight receipts for which totalled \$1,976.49. If a similar shipment over the same distance as the 13 cars travelled had been sent out of Duluth over the Great Northern the charges would have been \$95.26 more. Two cars of newsprint and posters handled over the C. P. R. last year earned \$65.98, while the Great Northern would have received \$47.49 or \$18.49 less in this case, but Mr. Lanigan explained that this was an isolated item in favor of the Great Northern. He said he could cite fully 80 lines of goods where the rates were higher on roads in the American west than in Canada. The sum total of the argument on the part of the railway officials has been to try and prove that the contention of the Dominion and western Provincial governments that American freight rates in the west are lower than Canadian rates is wrong. It is up to the Railway Commission to decide the dispute and it may be several months before the decision is handed down.

Tonawanda Trade Taking a Rest

North Tonawanda, June 23; (Special to the Canada Lumberman):—Lumber receipts are brisk but that is about all that can be found encouraging in the local market. Orders are none too brisk; in fact there is a well defined lull in business, but the fact that dealers are bringing down more than the usual amount of stock at this time of the year holds out encouragement for the future. There is thought to be no fear of the depression becoming at all permanent. There is too much building of all kinds in the territory supplied from the Tonawandas and excellent fruit and other crops will help immensely to bring good times back again as soon as it is positively known what the business world must contend with in the way of a tariff.

Lumbermen are interested in the preliminary report of the state engineer on plans for the 1,000-ton barge canal outlet into Niagara River which will make the Tonawandas the western terminus of the enlarged Erie canal. Instead of entering Niagara River via the mouth of Tonawanda Creek, which would be the shortest route, and through the heart of the lumber district, the close to ten mile current at this point will make it necessary to join the river a half mile farther south, at what is now known as the spillway. The latter point will not be as convenient for lumber interests as the Tonawanda Creek route would have been.

Fire last week completely destroyed the plant of the Newfane, Niagara County, N.Y., Basket Company. The loss was \$25,000 with \$13,000 insurance. The company was a large purchaser of lumber in the Tonawandas. S. D. Redman, of Lockport, is president of the company.

Spruce Lower at New York

Chase, Talbot & Company, wholesale lumber dealers, New York, report under recent date as follows:—"Since the first of the year, the average price of eastern spruce has declined about \$3 per M., and laths about 75c per M., being now quoted at \$4.25. Buyers of lumber are cute to take every advantage available, but nevertheless, we note an increased volume of inquiries, and a general improvement in the yard trade. The volume in the wholesale business has not been all that could be desired, and a tenacious tendency prevails among them to hang on to the buyer, until the price is squeezed down to the last penny."

Liverpool Market Report

Farnworth & Jardine, Liverpool, England, in their monthly wood circular under date of June 2nd, report as follows:—

Canadian Woods—Pine timber—There has not been an active demand. Waney 1st Class: The deliveries have again been entirely from the stocks held in Manchester; values continue high, but stocks are sufficient. For 2nd Class there has been little enquiry during the past month; values are unchanged. Square pine has not been in demand; the stock is light; values firm. Red pine is seldom enquired for. Oak—No arrivals; values firm; stocks almost exhausted. Elm—The market is almost clear of this wood, and is in good shape for the new season's shipments. Pine deals have reached the market sparingly by the liners. There has been a fair demand, and prices are unchanged; stocks are not excessive.

New Brunswick and Nova Scotia Spruce and Pine Deals—The import to the Mersey (including Manchester) amounted to 5,530 standards, against 7,000 standards during the corresponding period

last year. The arrivals have been chiefly to Liverpool; deliveries have been on about all fours with the import; stocks are moderate, viz., 8,670 standards, against 9,240 standards this time last year. Values have been well maintained and the market appears favourably inclined. Freight rates are firm.

Birch—Logs—The import of 44,000 cubic feet has been chiefly to Liverpool, about half from St. John, N.B., and half from Quebec. Deliveries have been somewhat disappointing; values are unchanged. Planks have been imported to about an average extent; the demand has not been very active, and stocks are adequate.

British Columbia and Oregon Pine—The import has been nominal. A fair demand existing throughout the month has left us with a very small stock, which is firmly held for full rates.

Siberian Pine—Logs have not been imported, and as the demand has been trivial, no impression has been made upon the heavy stock. Deals, etc.—No arrivals; limited demand; ample stock; values unchanged.

London Market Report

Churchill & Sim, London, Eng., in their monthly wood circular under date of June 2nd, report as follows:—

Business in pine deals is still confined to retail transactions at very high figures, and the demand, to a large extent owing to these quotations, continues small and fitful. Prices of spruce in London remain stationary, and there is no inducement in them to encourage large importations, which from the St. Lawrence, at all events, are not available. Little business has been arranged in Lower Port spruce, except to the out ports, and, as London merchants cannot see their way to pay the prices current in other districts, transactions have been confined to a few parcels of hardwood planks only. There is no change to record in the position of Canadian hardwoods, the trade in which has been very small in London.

From the St. Lawrence has been imported—

Pine Deals ... 16,000 pieces against 42,000 pieces in 1912
Birch Planks ... 5,000 " " 2,000 "

and from New Brunswick—

Pine Deals ... Nil pieces against 21,000 pieces in 1912
Spruce Deals ... 227,000 " " 152,000 "
Birch Planks ... 184,000 " " 215,000 "

British Columbian and Oregon pine—The market is quiet, but there is no change in the quotations for sailing cargoes of long timber, for which little tonnage will now be available for some time. London prices have kept quite firm, but the demand has been rather disappointing.

The stock of timber, deals, etc., at the public docks on the 31st May, was as follows:—

Foreign	1913	1912	1911	1910
Pine deals and battens in pieces	359,000	329,000	380,000	440,000
Red pine	20,000	36,000	47,000	47,000
Spruce ditto	451,000	402,000	452,000	459,000
Oak timber in loads	—	—	32	32
Oak plants, &c. (American) ..	1,592	1,972	1,271	1,113
Birch timber	172	151	88	526
Birch planks	3,679	2,819	2,373	1,914
Elm timber	341	124	676	416
Ash timber	—	—	—	5
Yellow pine timber	624	233	125	267
Red pine timber	—	—	—	10

Barbados Market Report

S. P. Musson, Son & Company, Barbados, B. W. I., report under date of June 6th as follows:—**Lumberstuffs**—White pine—There are no arrivals to report during the fortnight, and stocks are running low. Some cargoes are said to be on the way, but further supplies are needed and should sell at full prices. **Spruce**—We have just sold a cargo to arrive at \$27,000 for shipping which has filled present requirements. **Pitch pine**—No receipts. **Shingles**—No arrivals. Stocks are light and some further shipments should do well if of good quality. **Wood hoops**—We note the arrival of 400 bds. by steamer from London.

Alleged Wrongful Logging Operations

A writ has been issued by Mr. Aird Flavelle, at Vancouver, B.C., against the Canadian Puget Sound Lumber Company claiming compensation and damages in the neighborhood of \$140,000 for alleged wrongful cutting of 11,000,000 feet of choice timber on the limits belonging to the plaintiff near Powell Lake. Mr. Flavelle claims the timber under a Crown grant dated 1891. The Canadian Puget Sound Lumber Company is expected to claim in defence that its operations were based on a lease granted by the provincial government in 1905; that the government has accepted royalties for the same; that the

company is therefore not responsible and that the plaintiff cannot recover. Another suit is being brought by the Adams Powell Timber Company, claiming wrongful cutting on two timber leases adjoining the Flavelle Crown grant. In this case the damages and compensation asked amount to \$10,000.

Red Oak and Hard Maple Ties

Comparative Tests of Effect of Preservative Treatment—Absorption Greater for Hard Maple—Report by N.S. Forest Service

The United States Forest Service have issued a Bulletin No. 126, describing a number of experiments which have been made in the preservative treatment of red-oak and hard-maple cross ties. The conclusions reached are as follows:

(1) Under the same conditions of treatment a given absorption per cubic foot of wood was obtained in a shorter time in hard-maple than in red-oak ties.

(2) For a given treatment individual ties of hard maple in the same cylinder charge showed a greater variation from the average absorption than did the red-oak ties.

(3) There was less likelihood of excessively low than of excessively high absorption among the individual ties in a given cylinder charge of red oak.

(4) There was no appreciable difference in the penetration secured in red-oak ties treated by the full-cell creosote process, using 12 pounds per cubic foot of wood, and in those treated by the Rueping process, using 5 pounds of creosote per cubic foot of wood. In the maple ties the difference was very small.

(5) Both red-oak and hard-maple ties showed a greater penetration of creosote when treated by the Card than by the two-movement creosote-zinc-chlorid process.

(6) The penetration of preservative in hard-maple ties was largely in the sapwood and in the seasoning checks; it was very erratic in the heartwood.

(7) In the Burnett and Card treatments the average absorption of dry zinc chlorid per cubic foot of wood at a point 2 feet from the ends of 8-foot red-oak ties, determined by chemical analyses, averaged, respectively, from 13.5 to 15.4 per cent. less than the average calculated absorption per cubic foot for the entire ties. For the maple ties the difference was 26.6, 25.6 and 25 per cent. in the Burnett, Card, and two-movement creosote-zinc-chlorid treatments, respectively.

(8) The absorption of preservative per cubic foot of wood in red-oak ties was in inverse proportion to the moisture content and oven-dry weight.

(9) The absorption of preservative per cubic foot of wood in red-oak ties appeared to bear no relation to the proportion of sapwood in the ties.

(10) The absorption of preservative per cubic foot of wood in hard-maple ties increased as the proportion of sapwood in the ties increased.

(11) The absorption of preservative per cubic foot of wood in red-oak ties increased as the average number of annual rings per inch increased, but the variation was slight.

(12) The absorption of preservative per cubic foot of wood in hard-maple ties having nearly equal proportions of sapwood increased as the oven-dry weight per cubic foot decreased. The oven-dry weight per cubic foot of red-oak ties increased as the average number of annual rings per inch decreased.

(13) The rate of loss in weight after treatment was greater for red-oak than for hard-maple ties treated in a similar manner with creosote only or with the gas-house oil used in these experiments.

(14) The rate of loss in weight after treatment was greater for hard-maple than for red-oak ties treated in a similar manner with aqueous solutions of zinc chlorid, whether used alone or in combination with creosote in the two-movement process.

(15) It is believed that the results of these experiments on red-oak and hard-maple ties may, in the absence of any data to the contrary, be logically applied to other hardwoods in proportion to their similarity in structure to red oak and hard maple.

The bulletin states that the results of the experiments may be logically applied to other species of hardwoods having a structure similar to that of red oak and hard maple. The structure of conifers is so different from that of hardwoods however, that no attempt should be made to apply to them the results of these experiments.

It is proposed by the Montreal Board of Control to appoint a forestry expert to take care of the city's shade trees, and letters have been written to a number of cities asking for information on what is done and what are the results obtained. Mr. G. C. Piche, of the Department of Lands & Forests, P.Q., has written to the Board, approving of the idea, and stating that the planting of trees and their care has been so much advanced within a few years that many United States cities have regular staffs for the purpose.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

New Dry Kiln Instruments

The Morton Dry Kiln Company, 20 West Jackson Boulevard, Chicago, Ill., have recently perfected and put on the market three new instruments for use in connection with dry kilns. Illustrations and descriptions of these instruments are given herewith.

Fig. 1, is an illustration of a Troemroid Scalometer which is used to determine when the lumber is sufficiently dry. This instrument has a 2 oz. beam with 64 divisions on its upper edge and on the lower edge it is divided into 100 divisions. A specially designed percentage chart is mounted in a sliding frame attached to the base of the scalometer. Indicator pointers are attached to the frame, and by means of these and the chart, the percentage of moisture in the test pieces is determined definitely without any calculations.

It is customary to test lumber by removing a board from the side of the kiln car and cutting from its middle crosswise the board pieces to be tested. The pieces are weighed, using the divisions on the lower edge of the beam. At the top of the chart the corresponding number is then found and the pointer placed on the horizontal bar opposite this number.

Then the test pieces are placed on a hot cylinder or radiator for one or two hours and then immediately weighed. At the left side of the chart the number corresponding to this weight is then found, and the chart is raised until this number occurs directly opposite the pointer on the post. The percentage of loss will be found under the pointer on the horizontal bar.

Example: Assuming the first weight to be 90 and the second weight after the test pieces are dried as described above to be 85, if the percentage chart is operated as described above, the chart will show the loss of moisture to be 5.6 per cent. and therefore the lumber is dry enough to be removed. Lumber should be dried to show not more than 6 per cent. of moisture.

With the use of this instrument it is no longer necessary to guess at the conditions of the lumber. It can be used to determine how much moisture is in the lumber before it goes into the kiln, and it determines with absolute precision just when it is dry enough. It eliminates all chance of transferring the lumber from the kiln to the factory before it is properly dried, and it also shows if the lumber is over dried.

The instrument is simple in operation and can be used by anyone. It is made of the best material throughout, having agate bearings and polished brass finish.

ings and polished brass finish. The percentage chart is covered by a transparent celluloid so that it cannot be soiled or damaged in use.

The Morton Registering Hygrometer: shown in Fig. 2 consists of two specially constructed thermometer tubes similar to a physician's fever thermometer, mounted in a coppered case. The bulb of one tube is cooled by means of a silk wick extending into a glass vessel of water. When the hygrometer is placed in the kiln through a small opening in the large door and left 25 minutes it will automatically register the wet and dry bulb temperature. It may then be carefully removed and the recorded temperatures of both thermometers noted. The outside temperature will not effect the temperature of the hygrometer.

By means of the copyrighted chart shown in Fig 3, the humidity of the drying room can be determined.

Example: Assuming the temperature of the wet bulb to be 100

Tanners and Manufacturers

For Over 36 Years Makers of the Best Leather Belts

MONTREAL TORONTO ST. JOHN, N.B. WINNIPEG VANCOUVER

☛ To insure satisfaction—State where belt is to run ☛

degrees and the dry bulb 140 degrees, a vertical line extending down from the intersecting lines will show a humidity of 74 per cent. Take a reading early in the morning at each end of the kiln, and do not take one at or near the time of putting in or removing a car of lumber. Do not leave the hygrometer in the kiln but put it in a safe place after using.

Fig. 4 shows a Bristol Morton Recording Thermometer. This instrument is especially designed for use in lumber driers. It is made with a 25 ft. capillary tube extension which permits of placing the thermometer on the outside of the kiln, running the connecting tube through the wall and up to the ceiling. These instruments are furnished with a 7-day clock movement and with weekly charts ranging from 100 to 200 degrees.

This instrument records the temperature for every hour of the day and night upon the charts and the only attention it requires is to wind the clock and change the charts once a week. It tells you every morning if an even temperature and consequent steam pressure has been maintained during the night in the dry kiln and in the boiler.

The instrument is of the highest type of construction throughout and absolutely accurate. The case is neatly japanned, the door is nickel plated as well as the trimmings. Each thermometer is furnished complete with 100 weekly charts, padlock, key, bottle of special red ink and dropper, and 25 ft. of copper capillary tubing and bulb.

The Morton Dry Kiln Company advise that these instruments have all been thoroughly tested out before being placed on the market and a great number of them are already in use. They also state that to anybody purchasing these instruments they furnish free a complete card of instructions covering the use of the instruments, as well as the proper temperatures and humidity to carry for the different kinds of lumber, with complete instructions in reference to piling, and other information as to the operation of lumber driers to secure the best results.

Anybody interested may obtain full information and prices as well as literature by writing the Morton Dry Kiln Company, 20 West Jackson Boulevard, Chicago, Ill., and mentioning the Canada Lumberman and Woodworker.

A Powerful and Successful Liniment

One of the surest and most economical liniments for use upon a lame, sore or blemished horse, is Absorbine, "The Antiseptic Liniment," sold by W. F. Young, P.D.F. 424 Lyman's Building, Montreal, or to be had at regular dealers for \$2.00 per bottle. It may be applied to an open sore or wound with safety and with the assurance that it will kill the germs and cause a healthy healing. Absorbine is successful in poll evil, fistula, quitor, wire cuts, etc. It is very penetrating and soothing, stops lameness promptly and allays pain. A twenty year record makes it the remedy to use in removing bog spavin, thoroughpin, shoe boils, capped hocks, swollen glands, thickened tissues, rheumatic deposits, painful swellings, etc.; to cure any strain or lameness, to repair strained ruptured tendons, ligaments or muscles, and to strengthen any part that needs it.

The Future of Retailers and Small Towns

By Elmer C. Hole

There is a sentiment in this country, and some people think it is growing, that the retailer should be eliminated. He has been called the robber middleman. Some people believe that he is responsible for the high cost of living, and as a consequence they join in the cry of "down with the retailer." You and I know that the retailer performs an important part in the economic system of our country. You and I know that in his welfare is wrapped up the welfare of others, and anything that tends to pull him down or oust him out of business tends to eliminate or circumscribe the business of that community and as a consequence the shrivelling up of that town and interests located there. Anything that affects the community, that takes away the purchasing power from that community affects the retailer. Therefore, the retailer is especially interested in the development of the town and country around about it.

The wholesaler, the manufacturer, the jobber, the retailer, the editor of the local paper, the trade paper, and railroads are interested in the development of the local community and country surrounding it.

The retailer must cultivate the farmer. The townspeople must endeavor to break down the barrier between the country man and the towns man. They must show the farmer that he is vitally interested in the growth and prosperity of the town, since the schools and other public activities must be supported in order to furnish opportunities for pleasure and profit.

The railroads are also interested in the growth and development of the small town and the retailer. The fewer people there are in these towns the less business the railroads have and the local merchants and townspeople should co-operate with the railroads, as their interests are mutual.

The importance of the local editor is great in the country com-

munity and he can do more than any other agency to build up and solidify the best sentiments and best interests of the community. The children who are growing up to take the place of those now doing the business of the community must be kept interested enough to prevent the desire to go to a larger place. The development of the country town of the future depends upon them and they must be kept at home. A healthy environment for the children must be built up and a spirit of local patriotism instilled into them. The country needs its young men and the farms and villages and towns needs the young men and their interests can only be secured and retained by the co-operation of the older people. The city papers circulating in the country offer an allurements to the young people, which must be combatted by making the local paper of equal interest. This can not be done unless the merchants of a community give the paper their full support.

A Line Yard Manager on Retail Credits

It is an acknowledged fact that more business concerns, and I may say retail yard managers, fail because of an inability to collect than for any other reason. Since none of the rules for collecting bad accounts have worked out satisfactorily, the remedy for this lies wholly within the province of the credit man.

The best collecting in the world is done when the sale is made, by having all details of the transaction thoroughly understood, including the amount, time and manner of settlement. If the matter is to run for any length of time—be the customer ever so good—we should courteously suggest that it be closed with a note. This will protect us from possible loss by death or dispute and, incidentally, will bring us more interest.

If we do not know the customer to be responsible and reliable, the time to ask for collateral is when we are making the sale, and before the goods have been delivered. If he intends to meet the obligation promptly at maturity there can be no reasonable objection to making it secure, and if he doesn't, the sooner we find it out the better. Then, too, the majority of men are more susceptible to reason while wanting something you have, than they would be were the situation reversed, and we are much more likely to get our outstandings in collectible shape by anticipating this human tendency.

It is of the utmost importance to us, the retail managers, and to our employers that the people learn to regard their obligations to the lumberman with the same degree of seriousness with which they regard the note at the bank or with the supply man. We know that this is not the case at present—that too often the lumberman is the last of the three to get what is coming to him. There are reasons for this, and by a little concerted action our position can be improved considerably.

No one expects to secure a loan from a conservative bank without putting up some security that actually secures, either in reputation and financial responsibility or something more tangible, and the quicker we learn to regard and protect our stock as the banker does his capital, the quicker will we be able to eliminate the item of suspense account from our ledgers.

In some instances it may come hard for us in the beginning to insist upon the collateral necessary to put the matter in businesslike form, but after a little training it becomes second nature, and the more it is practised the less often are we called upon to practice it. There's more in "education of the trade" than first glance would indicate, and it is really an easy matter to teach the people in your particular territory that they can do business with you only on a businesslike basis. On the other hand by the indiscriminate granting of credit you soon find that the poorest risk in the country has driven in, had his wagon loaded, and driven out with a wave of the hand and an indefinite promise.

Our lien laws afford us no protection, hence we are obliged to be careful and cautious in extending credit, insisting upon security when necessary, and if in doubt lose an occasional bill to our competitor. It should be our aim to keep the outstanding personal accounts as near to the zero mark as possible at all times. If we can't get them off the books with a cash entry on the first of the month, they should be closed by note without undue delay.

In making a credit sale, or in taking a note we should never permit the debtor to think that in case it is inconvenient for him to make settlement at maturity, we will await his pleasure, but give him to understand that we expect, and will demand, that he fulfill his part of the contract to the letter.

You are not to understand from these remarks that I am an exception to the average manager, for I, too, at times get too anxious for business, afraid of driving away trade, and take long chances on getting the money; but if you would live long and prosper, don't do as I do but as I say.—F. C. H., in the Lumber World Review.

If you are looking for a choice business or manufacturing site in the west you will be interested in the quarter page announcement of the Taylor Mill Company in this issue.

EDGINGS

Ontario

The Northern Lumber Mills, Limited, Cobalt, Ont., suffered loss by fire recently.

The John Schoeder Lumber Company, Milwaukee, Wis., are making arrangements for logging in the townships of Wilson, Ferrie and Brown in the district of Parry Sound, Ont., and have engaged James Ludgate of Parry Sound to enter into contracts for taking out of timber.

The Wood Mosaic Company, Inc., of New Albany, Ind., has decided to establish a Canadian branch at Stratford, Ont., for the manufacture of veneer tops, panels and wood flooring. A site of 5 acres has been secured on which it is proposed to erect a plant to cost \$100,000 and employ 100 skilled workmen.

The Beaver Lumber Company, Limited, has been incorporated with a capital of \$75,000 to carry on business as lumbermen, saw and planing millers and manufacturers of lumber, woodenware, etc., with head office at Toronto. The provisional directors are W. J. Mitchell, Ernest Constant, W. S. Thomas and R. J. Christie, brokers, all of Toronto.

The Abitibi Pulp & Paper Company, Limited, have commenced the foundations for their pulp and paper mill at Iroquois Falls, Ont. The coffer dams have been constructed and the building of the dam is now under way. Working men's houses have been completed. The secretary of the company is Mr. J. A. McAndrew, 10 Adelaide street east, Toronto.

The Nestor Falls Timber Slide and Improvement Company, Limited, has been incorporated with a capital of \$30,000 to carry on business as a timber slide company to construct dams, etc., for handling logs, etc., with head office at Kenora, Ont. The provisional directors are J. W. Short, lumberman, C. J. Short, accountant, and H. A. C. Machin, barrister, all of Kenora.

Charles and Joseph Hadley have sold their interests in the S. Hadley Lumber Company, Chatham, Ont., to their brother Wm. A. Hadley. The business will be continued under the name of the S. Hadley Lumber Company, the officers being Wm. A. Hadley, president and general manager; Milton R. Bogart, secretary-treasurer. Mr. Bogart recently left on a business trip to Winnipeg and western Canada.

The MacCormack interests, who are completing a new two-machine newsprint mill at Thorold, Ont., have decided to build a seventy-five-ton sulphite mill immediately. They are purchasing their wood from Anticosti Island, delivered to the mill on the Welland Canal in barges. The new machines are 200 inches wide and driven by steam turbines. Mr. Warren Curtis, Jr., is the manager at Thorold.

The improvements to the Toronto Paper Company of Cornwall are nearing completion. The sulphite mill will have a double capacity by July 1st, which will provide a small surplus for sale. The company will also bleach its own pulp, and will not in future have to buy bleached sulphite. New water wheels have been installed and the power which the firm takes from the St. Lawrence is very much increased.

The Riordon Pulp & Paper Company, Montreal, have decided to extend their manufacture of sulphite pulp by the erection of a large plant in Northern Ontario, having a capacity of about 30,000 tons per annum. Plans and specifications are in course of preparation for the highest type of mill construction. Ground will be broken about the first of April next, and the plant will be in operation early in 1915. The Riordon Company have a capacity at their Hawkesbury and Merriton plants of 50,000 tons per annum, and the new mill will place them in the front rank of sulphite manufacturers on this continent. There are only two mills in Europe of a larger capacity. Mr. Carl Riordon, of the Riordon Pulp & Paper Company, Montreal, has just returned from a visit to England in connection with the business of his company.

Eastern Canada

The Violette Lumber Company, Limited, St. Angele, P.Q., have obtained a charter.

J. Arthur Doucet's sash and door factory, Grandes Piles, P.Q., was recently damaged by fire.

D. R. Saunders, Lake Annis, N.S., saw miller and lumber dealer suffered loss by fire recently.

Trudeau and Desjardins, Sherbrooke, P.Q., have been registered to carry on business as lumber dealers.

Z. Berthiaume & Company have been registered with a capital of \$20,000, the headquarters being in Montreal. The company have power to manufacture, buy and sell lumber, doors and sash, and all other products of wood.

C. H. Swift & Sons, Limited, Sherbrooke, Que., have obtained a Dominion charter to carry on business as lumber manufacturers. The capital stock of the company is \$150,000, and its incorporators include C. H. Swift, Jr., Utica, N.Y., A. C. Bissell, E. H. May, F. F. P. Houllahan and F. S. Rugg all of Sherbrooke, Que.

The Escanaba Veneer Company, Escanaba, Mich., suffered a serious loss by fire on June 13th when their veneer mills, at Sutton, P.Q., were destroyed. The loss totalled about \$75,000. The plant was burnt to the ground with all the equipment and machinery. The insurance on the stocks and plant amounted to \$50,000.

The head office of the St. Lawrence Pulp and Lumber Corporation, for carrying on its manufacturing and selling business will be at Pabos Mills, P.Q. The head office of the legal agent of the company will be at New Carlisle, P.Q. An interesting description of this company and its plans was published in the Canada Lumberman of June 1st.

J. & W. Duncan, Limited, are constructing a new planing mill at their yard, 1833 Ontario street east, Montreal, to replace a mill burned out last Fall. It will consist of two storeys, and will be constructed on a site 110 x 75. The foundations will be of concrete, and the building of solid brick. The floors

will be of spruce and the roof of felt and gravel. An engine of 150 h.p. will be installed, together with nine wood working machines.

The H. E. Talbott firm of engineers, which is in charge of the construction of the power dam for the Laurentide Company at Grand Mere, Que., has taken over the contract to complete the plant of the Donnacona Paper Company, near Quebec, and will build both the dam and the paper mills. The plant will therefore come into operation this season.

Western Canada

Knowles & Smith are completing their mill at the mouth of the Courtenay River, B.C.

Lewis C. Wells, lumber dealer, Roblin, Man., has sold his business to J. D. McLaren.

The Bridge River Timber Company, Limited, Vancouver, B.C., have been incorporated with capital stock of \$300,000.

A sawmill, planing mill and shingle mill will be erected on the lake shore site adjoining Edgewood, B.C., by W. J. Banting.

The Marcum Lumber Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of \$50,000.

The Fleck Timber Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of \$50,000.

The Royston Saw Mill Company, Limited, has been incorporated with head office at Sunderland, B.C., and capital stock of \$20,000.

Nelson & Foster, 1398 Erin street, Winnipeg, Man., have obtained a permit for the erection of a sash and door factory at a cost of \$5,000.

The cedar mill and sash and door factory of the Canadian Western Lumber Company has now been completed. The plant will employ 1,700 men with a monthly pay roll of \$75,000.

The Finger Lumber Company, which operates a large mill at Le Pas, in northern Manitoba, has opened yards in Winnipeg, and large sheds are now being erected there by the company.

The Shields Lumber Company, Limited, has been incorporated with head office at Kamloops, B.C., and capital stock of \$500,000. J. C. Shields, lumberman, Kamloops, B.C., is attorney for the company.

The Bute Inlet Timber Company, Seattle, Washington, has obtained an extra-provincial charter to carry on business in British Columbia, with head office at Vancouver. The capital stock of the company is \$50,000, and Mr. Chas. W. Craig, Vancouver, B.C., is attorney.

The Benton Pulp & Lumber Company, 167 Howard street, Spokane, Wash., has secured an extra-provincial license to carry on business in British Columbia, with head office at Erie, West Kootenay, B.C. The capital stock of the company is \$50,000 and its attorney is W. J. Wilson, of Erie, B.C.

The Ocean Lumber Company, Seattle, Washington, has obtained an extra-provincial license to carry on business in British Columbia. The head office for British Columbia is at Vancouver, and Mr. Fred T. Satterford, Vancouver, is attorney for the company. The capital stock of the company is \$25,000.

D. K. Campbell, Vancouver, B.C., has purchased from the B. C. Mills Timber & Trading Company, Crown granted timber limits on the south side of the Fraser River opposite New Westminster. The limits contain about 75,000,000 feet of fine fir and cedar. The price was on a basis of \$3 a thousand foot.

A logging camp operated by the Forest Mills, Limited, at Taft, B.C., was recently destroyed by fire. A heavy wind was blowing at the time and the total damage amounted to between forty and fifty thousand dollars. Over two million feet of logs on the skidways was destroyed. The loss is partly covered by insurance.

The Globe Lumber Company, Limited, and the Reliance Lumber Company, Limited, have recently effected a change in the handling of their interests in Alberta. The Globe interests at Ryley and Bruce have been assumed by the Reliance Company, and the former concern has purchased the yards of the latter at Tofteld, Holden and Viking.

The Vancouver Timber & Trading Company, Limited, Vancouver, B.C., in a recent letter to the Canada Lumberman confirm the report that they intend to erect a large sawmill opposite Port Moody, B.C. Their plans at present are not sufficiently advanced to publish any detailed information. The address of the company is Suite 2, Pacific Building, Vancouver, B.C.

The Edgewood Lumber Company, Castlegar, B.C., whose planing mill was destroyed by fire on April 6th, report that it has now been re-built and put into operation with the following equipment:—1 No. 91 Berlin planer and matcher, 1 No. 108 Berlin moulder, 1 No. 341 Berlin band re-saw, 1 No. 257 Berlin self-feed rip saw, together with all the necessary filing room material.

A report from Port Moody, B.C., states that work on the construction of Robert McNair's new shingle mill on the north shore is proceeding rapidly. It is expected that, at the outset, about 75 men will be employed in the mill. Manufacturing operations will probably be commenced towards the end of the present summer. This mill will give Port Moody two of the finest shingle mills in British Columbia, the other being the mill of the Thurston-Flavelle Lumber Company, which was recently purchased from the Emmerson Lumber Company.

A lumber company has been organized at Moose Jaw, Saskatchewan, called the Assiniboia Lumber Company, Limited. The directors are C. D. McNab, of Cranbrook, B.C.; E. R. Birnie, Calgary, Alta.; V. Hyde Baker, Cranbrook, and H. F. Peterameyer, Moose Jaw. Branches have already been established at several towns in the province and the old yards of the Coast Lumber Company, Limited, at Moose Jaw have been secured by the company. The firm is really a reorganization of the Bouseman Lumber Company, Limited, and operates its own mills.

Shareholders of the British Canadian Lumber Corporation, Limited, have been asked to authorise a bond issue of \$3,500,000 to bear interest at a rate not greater than 6 per cent. per annum, to be disposed of as required to carry on the business successfully, pay off the existing liabilities, provide for the erection of the company's mill at Port Renfrew, secure additional sales yards at various points, and give the company ample working capital. It is stated in the letter to the shareholders that with the four mills which the company will have in operation, as soon as the Port Renfrew mill is completed, the capacity will be 150,000,000 feet board measure per annum.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Test the Shimer Cutter Heads

The Shimer Limited, with Expansion, Fig. 628, Groove Head with 8 Bits and self-centering and spindle clamping features. Price \$36.23 each, complete.

The Shimer Limited in solid section, Fig. 625, Groove Head with 8 Bits and the self-centering and spindle clamping features. Price \$33.50 each, complete.

Fig. 203, Popular Expansion Groove Head with 4 bit seats, complete, net \$20.48. Made also with 6 and 8 Bits to each Head.

and see if they are not as good or better than they are guaranteed to be. Our trial offer makes it easy for you to do this at no expense or risk whatever.

Shimer Cutter Heads are conceded by practical mill men everywhere to be the best and most efficient ever produced. It is not an unusual experience for them to pay for themselves before the bill becomes due in the saving of time, material and labor.

In addition to the savings thus produced and with the removal from the mill of many annoyances and worries, the user of Shimer Cutter Heads is free to work his machines for "quality" and "quantity" output.

The quality feature of the work means the building up of your business and better prices for your material. All additions to the quantity turned out each month means that much added to your profits.

These features should lead you to make a trial of our tools on regular or special work. Give us measurements of your machine, speed at which you wish to feed it, and send sample or drawing of what you wish to make. We will then design the best heads for the purpose, send them on trial and allow you to satisfy yourself before paying for them.

Can you ask anything fairer than this proposition?

Address **SAMUEL J. SHIMER & SONS**, Galt, Ont., Can.

J. J. Newman Lumber Co.'s Shed, Hattiesburg, Miss., Roofed with J-M Asbestos Roofing

A Big Money-Maker for Lumber Dealers

There is an enormous demand nowadays for a ready roofing that gives fire protection.

J-M Asbestos Roofing is the only roofing that fully satisfies this demand—because it is the only roofing made of that wonderful fire-proof substance—Asbestos. This means that when you sell this roofing you have no competitor. And there is a handsome profit in every sale.

J-M ASBESTOS ROOFING

is composed of Asbestos and Trinidad Lake Asphalt. Being all-mineral it affords perfect fire protection, never rots, rusts or deteriorates. Therefore, it never needs coating or any other preservative. It is the cheapest-per-year roofing on the market. These are selling points that your customers will quickly appreciate.

Our campaign of advertising, costing thousands of dollars a year, is educating people everywhere to the advantages of this roofing. Right in your territory there are scores of property owners, architects and builders who will become live prospects for this roofing the minute you let them know you are handling it. And as we have only one dealer in each town; all this good business goes to that dealer! Will that dealer be YOU?

Don't delay. The roofing season is here. Write our nearest branch today for Catalog and Special Dealer Proposition.

THE appeal of the FAY - EGAN
"LIGHTNING" No. 159 is to the mill owner whose Matcher must do lots of work, and anything from thin narrow flooring to No. 117 Siding or Medium Timber Sizing.

- 1—Because it is made either four or six roll and in widths to meet all needs, 10," 15," 20," 24," and 30".
- 2—All widths will take stock up to 8" thick.
- 3—With a center guide, it will S3S of two pieces at one time.
- 4—Feeding capacity to suit the needs of mill where used.
- 5—Fitted with circular heads, thin "Tungsten" air hardened steel knives and with jointing and setting attachment, to do the same high grade of work that is produced on the "333".
- 6—Over-swinging cutters can be used on cylinders for mouldings up to 1" deep or can be fitted with our No. 288 Profiling Attachment (the same as used on the "333").
- 7—Every gear on the No. 159 is cut from the solid, the drivers completely cased and running in grease. The drive is absolutely silent, and where this is the case power consumption is necessarily low.

Won't you give us a chance to tell you more about the No. 159 and what it will do for you?
Just drop us a card today.

Locomotive Boiler on Skids

B. G. Luther Co., Inc.

91 Foster Street

Worcester, - Mass.

AUTOMATIC CUT-OFF SAW

ESTIMATED capacity: 30,000 feet, 2" stock in 10 hours. Cuts with perfect accuracy. Will carry from two to six 13" saws. A great labor saver.

Write for particulars.

The Keystone Pole Tram Car

Pole Tram Car.

Indispensable to every saw mill. It runs on poles from 6 to 10 inches in diameter and the wheels are concave.

This method of conveying logs, pulpwood, or coal is undoubtedly the best and the cheapest that jobbers and mill-men can use. It can be used to great advantage on low and marshy ground.

We would appreciate the opportunity of furnishing you with further particulars.

Rothfuss-Howard Iron Works
Williamsport, Pa.

The Rat Portage Lumber Co., Ltd.

With Mills at Winnipeg, Man. Vancouver, B. C. Harrison River, B. C. Kenora, Ont. Rainy River, Ont. and Banning, Ont.

Manufacturers of

Lumber, Lath, Shingles, Sash and Doors

And all kinds of Woodwork and Interior Finish. Also Box Shooks and Packing Cases. White and Red Pine Lumber, Maple Flooring, Hardwood Lumber, Turned and Band Saw Work, Cedar Posts and Poles, Tamarac, Piling etc.

The Most Economical Belt Service

you can buy is the extra service afforded by

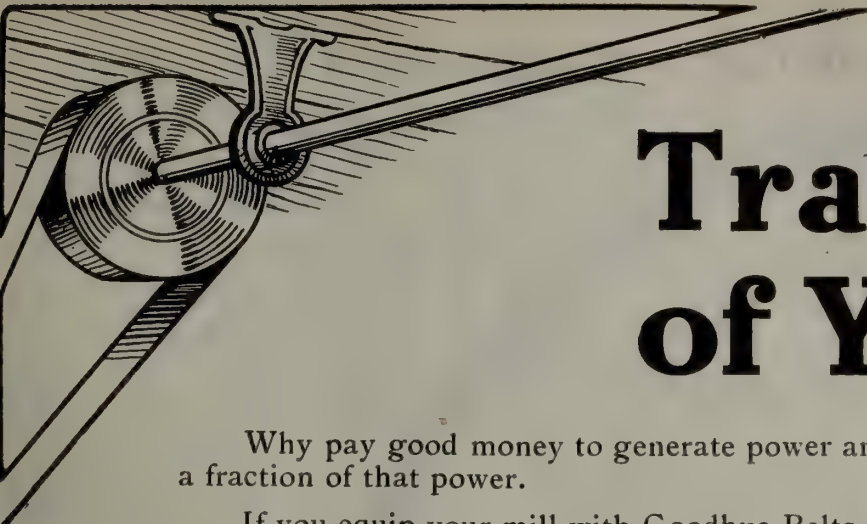

SCANDINAVIA

the original solid woven belt—has no plies to come apart.

Federal Engineering Co., Limited, TORONTO, MONTREAL

**WE CAN
SAVE
YOU
MONEY
on both
maintenance
and first
cost**

**Write

Catalogue**

Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

Write us for particulars and prices

**YOU CAN DO
IT WITH—**

A GOODHUE BELT

J. L. GOODHUE & COMPANY, LIMITED.
DANVILLE, QUEBEC CANADA.

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.

by using our
**Patent Steel Band
Mill and Carriage**

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

*Quality
Sells*

**Price is not a
determining factor
unless quality is
considered**

Quality is the "keystone" of **all** Disston Products—the prices within the reach of mechanics everywhere.

Improvement of that high quality of material, temper, design and workmanship which has gained world-wide renown for

DISSTON
SAWS,
TOOLS,
FILES,

has kept pace with the steadily increasing requirements as evidenced by the ever-increasing demand and the great growth of the plant itself.

Disston Steel and shop treatments defy successful duplication of Disston Quality and Efficiency—a guarantee of continued supremacy.

All F.O.B. Jamestown, New York.

\$90 to \$9,000 per Year

Cling-Surface treatment of your belts may save much of this for you ever year.

The table below was compiled on the assumption of 4 lb. of coal per horse power hour, 300 working days per year, 10 running hours per day, and a coal cost of \$3.00 per ton.

Horse Power Percent Saving in Power

Plant	10%	20%	30%	40%	50%
50	\$ 90	\$ 180	\$ 270	\$ 360	\$ 450
100	180	360	540	720	900
200	360	720	1080	1440	1800
300	540	1080	1620	2160	2700
400	720	1440	2160	2880	3600
500	900	1800	2700	3600	4500
1000	1800	3600	5400	7200	9000

In a 200 h.p. plant operated with tight belts and friction load of 40 per cent., which is a common figure, treatment with Cling-Surface will reduce the friction load possibly to 20 per cent. The 20 per cent. power saving thus affected, according to the table, amounts to \$720 per year. Isn't that worth while?

The Southern Engineer published this practical example in Jan. 1913 issue:

"A manufacturing plant of 250 horse-power nominal rating required an average of 268 horse-power for 10 hours a day.

"The question was raised as to the actual losses due to tight and stiff belts. This led to the application of the indicator."

The Southern Engineer concluded that proper belt and pulley management in that plant "Would mean a saving of 1,139 pounds of coal in ten hours. At \$3 a ton this means a saving of \$1.79 a day. \$1.79 a day or \$537.00 a year was being wasted."

We needn't say more. Cling-Surface would do much in the above plant and besides it stops slip, waterproofs and preserves belting, and it makes belts pull without making them sticky.

Let us refer you to nearby installations where savings have been made in this direction.

Write now for more facts, figures, and literature.

Timber Grows in Value

Steadily, Persistently, Consistently

HERE ARE THE REASONS:

DEMAND increases with the increase in population and in time becomes competitive in character.

SUPPLY becomes less each year almost to the extent of the annual cut.

INTENSIVE USE. Kinds and qualities of timber now regarded as valueless will be marketable in a few years. Estimates now regarded as fairly exact will be made valueless in a few years within which time more of the timber will enter the "merchantable" class.

These are not ARGUMENTS they are FACTS. Take them into account before deciding on your next investment.

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

Four Inch Steam Set Works

Will increase the capacity of your mill

Because it lightens the work of your setter, making it possible for him to put through more logs every day.

Because quicker work is possible with it than with a hand operated machine.

Because it will set up to 4 inches with each throw of the lever instead of only 2 inches which is the limit of most hand operated set works.

These are some of the reasons why several operators have increased their cut over 2,000 feet per day. You can do as well.

Send for catalogue L-6.

KEEP YOUR EQUIPMENT GOING

YOU make money when you keep your equipment going. You'll earn most with equipment that will wear a long while and is easily and quickly repaired. This applies particularly to locomotives.

Our locomotives are designed and built for long life, hard work and quick repairs.

Extra parts are kept in stock for immediate shipment. These are made in jigs and to gauges carefully checked. Rigid adherence to standards of material are supplemented by strict

inspection and tests. Each repair part must therefore go into place with the same degree of perfection as the original part. No machine shop is necessary. This is important when the locomotive operates at a distance from a repair shop.

Consider this when you purchase a locomotive.

Branch VANCOUVER, B. C.

The
Markof
Quality

3 Saw Improved Lath Bolter

Points Worthy of Notice

Main frame made in one piece.
2 lower feed rollers 5" diameter
and **power driven**.

2 upper pressure rollers both
power driven.

Front pressure roller raises to-
wards the saws, and being power
driven prevents bolts from flying
back out of the machine.

Bolts cannot stick.

At the price we sell this mach-
ine it has no competitor.

Long's Quality Lath Bolters

4 Saw Lath Bolter

A machine for mills of
large cutting capacity

Please notice

this machine has—Three Mandrel bear-
ings, the outer one being easily removed
for taking off saws for filing.

Four lower feed rollers, all **power driven**.
Two top pressure rollers, **power driven**.
Bolts cannot stick or fly back.

Better Lumber— *And More of it*

Difference in lumber values is due to two things—quality of timber and the quality of the sawing.

If you have A-1 lumber, why cut it in a mill that will lower its market value.

You get the best that is in your timber by sawing it right, with

WATEROUS SAWMILL MACHINERY

We manufacture a complete line for the full equipment of light, medium and heavy mills—Circular or Band.

Every improvement that tends to increase accuracy and rapidity in cutting, has been incorporated in our designs.

For over 50 years Canadian Sawmill men have been cutting timber with Waterous machinery. The experience that we have acquired in this period is built into our product, and the reputation for satisfactory service which our installations have earned, is upheld in the machinery we sell to-day.

There is a Waterous equipped mill somewhere in your neighborhood. We will be glad to tell you where. Watch our machines at work and ask the operator and the owners what they think of them,—then write us for specifications and prices.

If you have any of our old bulletins on file, destroy them and ask us to send you our latest Sawmill bulletins. These are assembled in a handsome cloth binder and are full of interesting information that make them invaluable as a handy reference for the practical mill man.

A post card will do—send it to-day.

The Waterous Engine Works Co., Ltd.

Brantford - Canada

H. B. Gilmour, Vancouver B. C.

Winnipeg, Man.

\$5,000,000.00

worth of mixed metals is what we market every year

PEERLESS metal is compounded specially for sawmills and is the best on the market for that purpose.
FAULTLESS metal is a high grade copper hardened alloy made for heavy duty work, sawmills and engines.
 Our policy is large tonnage, perfect alloys, and absolutely fair and honest treatment of the trade.

We offer for Prompt Shipment :
Spruce, Pine, Hemlock and Birch
all sizes,
Rough or Dressed

15,000,000 Feet ALWAYS ON HAND.

Our Double Band Mill, Huttig, Ark.

With two mills like this we manufacture 40,000,000 feet of band sawn Southern Hardwoods annually. We guarantee our lumber to be of excellent widths, full thickness, and to contain 50% to 75% of 14' and 16' lengths. We make high grades and all of the "CREAM" is in each grade. Send us your enquiries.

WISLUMBCO STANDARDS

THE BIG DEMAND FOR "Defiance" Woodworking Machines

Is a plain case of "survival of the fittest." Through years of ordinary and unusual service in hundreds of woodworking machines, they have proven the most durable and longest lived. And to no little extent is this durability due to the fact that

OUR PLANT IS SO EFFICIENTLY EQUIPPED

Every Defiance machine is accurately machined and perfect to the smallest detail. Consequently their performance must be positive and out of the ordinary.

Further information concerning their trustworthiness will be furnished upon application.

The Defiance Machine Works Defiance, Ohio, U.S.A.

"The Narrow Saw King"

The Narrow "Saw King" Cross-Cut Saws have won their way to universal popularity by the good work they do and their general reliability. They have been put to every test and come through successfully, proving that they are worthy of the confidence placed in them. If you want the best results, use a Narrow "Saw King."

The Narrow "Saw King" Cross-Cut is specially adapted to Pulp wood and Small timber being a straight back Saw and ground to a true taper, three gauges from cutting edge to back of saw.

BATHURST, NEW BRUNSWICK

When the gang draws pay for loafing

THE Millman who is studying for efficiency must see the waste in using Belts that go wrong—tying up the whole outfit. He must see the waste of precious time—which is money. He must also see the loss entailed by a gang being thrown off work, but not off the pay roll.

A cheap belt piles up a bill of expense that may seem purely incidental—but which is directly attributable to poor belting.

A belt runs slack and must be fixed—stopping an expensive machine, wasting the men's time which runs quickly into money—often falling down on deliveries and losing business.

A Goodyear Belt will not run slack—Because it will not *stretch*.

In the making of Goodyear belting, the many plies of hard-fibre cotton duck—each thoroughly permeated with rubber “friction”—are compressed into a solid combination of strength and grip.

The Goodyear “curing” or vulcanizing is done while the Belt is stretched to its utmost limit by special machinery. All tendency to stretch in service is taken away. That is why Goodyear Belts do not *stretch* in service.

The toughness of carefully-tested cotton fibre, inseparably united under tremendous pressure with high-grade rubber friction, makes a pliable Belt of great strength.

GOODYEAR BELTS

Goodyear Belts grip the pulleys. They convey **ALL** the power because they do not slip. The outer surface of rubber holds tenaciously to the pulley. The belt is pliable under any weather conditions.

This rubber covering protects the inner fabric of the Belt from rain, oil, etc., which would cause rot and decay.

Neither heat nor cold, rain or shine, can affect the pliability and effectiveness of our Rubber Belts. They remain soft under the hardest service. Repeat orders from millmen, and big increases in sales, prove that they are satisfying the demands of experienced men.

Can you reduce the cost of your Knives ?

There is one good way to do this. Not by paying less first cost for Knives but by getting the best that the market affords. The Simonds Knife is, we claim and would like to prove to you, a Knife that will hold its cutting edge for extra long service. The saving comes in the length of time you can run a Knife without stopping to grind it also in the length of life of the Knife. We manufacture at our Montreal factory all styles of Knives and Bits and we will promptly fill your orders for anything in this line you may specify.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 33

Toronto, July 15, 1913

No. 14

The Value of Top Lopping

A report has been made by the New York Conservation Commission upon the efficiency of top lopping. The law required that the tops be lopped by the lumbermen at their own expense, and but little objection was made to its enforcement until last year. Then, protests became so numerous that the superintendent of forests held several hearings to ascertain the objections in detail, and also made a personal investigation of the areas upon which tops had been lopped. The opponents of the measure claimed that fires can be fought easier where tops have not been lopped; that the unlopped trees decay faster than the lopped ones; that fires are more severe in lopped areas than where the tops are not lopped; that the cost of lopping is too great; and that in any event, it is not necessary to lop tops less than three inches in diameter. After fully investigating the situation, the superintendent of forests concluded that top lopping is beneficial in New York in the prevention of forest fires. In his report to the commission, he summarizes his observations as follows:—

"First—That the top lopping law does very materially increase the fire protection, because the period of danger after lumbering is greatly shortened. It is admitted that if a fire does occur within two or three years after lumbering, the damage will be fully as great, and in some cases worse, when lopped, but this danger exists for a far shorter period.

"Second—That the thoroughness with which the lopping is done has much to do with the future results. If the operator appreciates that proper lopping induces decay and endeavors to get the brush as close to the ground as possible, excellent results will be obtained.

"Third—That a limitation may be made beyond which it is not

necessary to lop. We believe that if any tree, limb or top has its branches cut off from any part which is over three inches in diameter, the material will be sufficiently near to the ground to induce decay and that lopping below this size is an unnecessary waste of time and money."

Recommendation is made that the law be modified to give the Conservation Commission sufficient discretion in its enforcement so that lopping may not be required under local conditions that render unlikely the spread of fires in unlopped areas.

An Opportunity and a Crisis

Canadian manufacturers of doors have watched with concern during recent years the increasing imports of doors manufactured by the large plants in the United States. An attempt has been made in Ontario to fight this competition by creating sentiment against it, but there has been practically no definite result, the real source of the trouble being the modern and extensive equipment of the United States door plants as compared with those in Canada. Canadian door manufacturers are now realizing the truth of this and the near future will probably see the erection of Canadian plants but on a scale that will enable manufacturers to meet the competition from the United States. In British Columbia for instance one plant of this nature has already been built for the production of fir doors, which will probably prove that the situation can be controlled by energetic competition better than by seeking to create sentiment in opposition to the imported product. From a purely business point of view this is the same method of meeting the situation. Other Canadians should follow this example and try to meet the competition on equal grounds before complaining of it as an injustice.

The export trade of the United States in sash and doors has practically trebled during the past five years. From the United States point of view the situation is exceptionally encouraging, as the foreign markets, including Canada, instead of being glutted, seem to be anxious for more. There is every indication of the trade continuing to grow. This was not always the case. About nine years ago the United States export trade in sash and doors amounted in value to nearly a million and a half dollars, but an era of bad trade followed until in 1908 the total was only \$479,266. Then improvement gradually returned until, during the fiscal year 1912, the total export trade of the United States in sash and doors again passed the million dollar mark, the total being \$1,180,366. The trade therefore, is steadily approaching its proportions of ten years ago. Moreover, instead of showing any sign of receding, the report for the nine months ending with March shows a total for that period practically equivalent to the total for the entire previous twelve months. The total for the present calendar year will apparently pass the million and a half mark. Canada's share of these doors—by far the largest share of any—amounted to over half a million dollars worth, practically four times the total of ten years ago.

Nine years ago, when the high record occurred, England was the largest foreign customer, taking over half a million dollars worth of sash and doors in one year. From that time however, England's purchases have dwindled down to a little less than a quarter of a million dollars worth. The present indications are that the English trade can be built up again to something like its old proportions and in the meantime the Canadian trade is growing rapidly. Last year it was double what it was the previous year. Trade with other countries is also being developed in like manner. In the Argentine for instance, a little order for \$113 worth was put through in 1906. This was the forerunner of better things. Last year the total shipments of United States sash and doors to the Argentine were valued at \$44,071. Ten years ago the trade with Australia amounted in value to \$79,804. It dwindled for some reason until 1911, when it was only \$200. Then a recovery took place and last year the total value was \$58,606. The trade with South Africa ten years ago was valued at nearly half a million dollars. It also declined and was only \$62,492 in 1908. Since then it has been doubled. Last year the total was \$129,282.

The figures are instructive to Canadians. In the first place they seem to contradict forcibly the claim that the exported doors are cheap grades, shipped sometimes at a loss, to capture a foreign mar-

ket or to avoid injury to the home markets. Expansion of this nature point strongly to modern equipment, skilled workmen and intelligent business management. Dumping methods have unquestionably been a factor at times, but they cannot account entirely for continued growth of export trade. Practical production of a good article at a closely competitive price is the reasonable explanation. Canadian manufacturers have admitted to one another that the reason for the increasing imports is largely the wonderful equipment, enormous capacity and skilled workmanship, which characterize so many of the United States plants and organizations. When these are backed by the strenuous methods of United States salesmen, the story is much more than half told.

The situation should be studied more critically by Canadian manufacturers. Such a study will lead to one certain conclusion, namely, that the opportunities for Canadian manufacturers of sash and doors to-day, are almost so great as they are for those of the United States. It is unquestionable that the same methods, put into practice in Canada would bring similar results. We can get the United States lumber if we want it. We can use our own if it is preferable. We have but to invest our money in equipment and organization on a scale commensurate with the opportunities and push our sales with the same vigor. It would be only a few years, under such conditions, before we would secure enough of the foreign trade our-

selves—some of it in the United States too—to make us indifferent to the relatively small quantity of United States products coming into our own markets. This is the only logical outcome of the situation. We have remained content with a large foreign trade in rough lumber and timber for many years. The time has come—long ago now—when we should be sending out of the country a much larger percentage of manufactured articles, rather than the rough material. This is the true national business policy. Let them forget the hopeless fight for tariffs to back up half-hearted enterprise and step into the ring, ready for anything, without looking for the privilege of a handicap against the other fellow. Duty is a necessary source of protection in many cases and we do not wish to forego its assistance wherever it is practical or necessary. It is a valuable protection—above every thing else—against unfair competitive sacrifices. It is often advisable and may even be so in regard to the sash and door industry. But the wiser course to-day is to devote less attention to this feature of the situation and more to the opportunities for doing things on a bigger scale and in a more independent manner. Canadian sash and door manufacturers have an encouraging future to look forward to. They will undoubtedly realize the opportunities that are developing. The question is how soon and how thoroughly will they do so. The situation is one which presents both an opportunity and a possible crisis.

Forest Products Exposition Assured

Much discussion has appeared in the United States lumber trade press during the past year or more, of a proposal to hold a forest products exposition. Little or no opposition has been expressed, the writers invariably viewing with one another in presenting valuable suggestions for the promotion of the plan. The unanimous opinion has been that the unique and successful exhibitions held by the cement products industry, and by others, have made it imperative that the lumber industry should come forward with a similar plan and show the consuming public all the facts in favor of wood. Official announcement will now be made within a few days that the outcome of all this discussion will be the holding of a forest products exposition at two or three United States cities during the coming winter—probably during January, 1914. The National Lumber Manufacturers' Association backs and finances the enterprise, and already \$25,000 for the purpose has been pledged. The exposition thereby becomes a reality. The thousand and one details of making the show a success will be handled by a strong committee of lumbermen.

In Chicago the exposition will be held for two weeks in the Coliseum in January next. But the plan is that other cities will be favored with similar expositions under the same auspices and the whole country given an opportunity to see the newest developments in building material and the machinery that enters into its manufacture from tree to finish.

The show should attract lumbermen, architects, contractors and home-builders from a large area of country, with resultant benefit to the lumber industry. Lumber was the material that made possible

the upbuilding of the towns of North America, from the smallest hamlet to the largest metropolis. It always will occupy its position as the chief construction material of the nation. It puts homes within reach of men of moderate means; it has made possible the speedy improvement and growth of new communities.

In recent years the inevitable substitutes have put in an appearance. Many of them have been meritorious. Others have fallen far short of giving the service that a good forest product would. To some extent the public have been led away from lumber, with loss to themselves and the lumber industry. The exposition should serve to re-establish lumber in many minds as the only suitable material for many purposes.

The exposition will not only appeal to the general public, but will be of special interest to lumbermen, for it is intended to show machinery for each department of lumber manufacture. It will begin at the stump and follow the products of the forest through their various stages of refinement for the uses for which they are intended.

The Government exhibit will be of unusual value. It will do much to promote the conservation idea. At the same time the opportunity will not be overlooked to relieve the public mind of the idea, fostered by promoters of substitutes, that the forests are exhausted or are in danger of marked reduction within the lifetime of any person now living. The exposition can serve good purposes; and, under the direction of the National Lumber Manufacturers' Association, should be of tremendous good to the trade.

Editorial Short Lengths for Busy Readers

The many complaints as to lack of cars for getting out pulp wood, pulp and paper on the lines of the Intercolonial Railway in New Brunswick and Quebec are likely to have effect in a radically reorganized service in the near future. A new manager has been appointed for the line, and he is now planning the double tracking of a considerable portion of it, the improvements of the grade and great additions to the terminal facilities and rolling stock.

The bankers of New Brunswick have recently taken a hand in behalf of the lumber interests and sent a delegation to the provincial government to ascertain the full purpose of the recent legislation

requiring a bonus for renewal of Crown land leases. C. H. Easson, St. John manager of the Bank of Nova Scotia, and E. A. McCurdy, manager of the Royal Bank at Newcastle, with H. A. Powell, K.C., as counsel, were in attendance and the matter was very thoroughly discussed. Members of the government said after the meeting that the gentlemen who attended were satisfied with the explanation that the bonus was being asked in case of renewals in lieu of having the areas put up at public auction, the government taking the stand that the province was entitled to an advance on the upset price when competition was eliminated. Application for renewals must be filed before August 1st, although the leases have still five years to run. The bonus is to vary, according to location and desirability of the lands.

Woodworking Plants Well Conducted

Factory Inspectors Commend the Owners in Ontario
for Complying with Requirements of the Law

The reports of the Inspectors of Factories for the Province of Ontario which have just been published contain several interesting references to matters which concern the lumber and pulp and paper industries. The Chief Inspector dealing with the question of fire protection gives a series of practical suggestions which apply especially to woodworking trades. They are as follows:—

All departments to be clear of refuse of all kinds.

Water barrels to be kept filled with water and fire buckets put in their places. These barrels must not be covered at any time. Water to be changed when it becomes impure.

Sand-boxes to be kept filled and shovel handy at each box. Extra bucket filled with sand, ready for use, to be set on top of sand-box.

See that all fire extinguishers are in their proper places and are in working order. The complete equipment of fire extinguishers should be tested once a year, one or more each month.

All fire hose to be taken out and tested twice each year, and if any repairs are necessary report to office.

All rags and refuse must be kept in standard metal waste cans, and these cans to be taken by elevator man to yard before the machinery stops, and must be removed from the premises the same day.

Use spittoons made of metal only, and never to contain any sawdust.

Gasoline, naphtha, or other volatile oil should not be kept in building.

Gas brackets must have stiff fixtures. If it is necessary to use swinging brackets, all exposed woodwork must be protected with sheet metal, leaving an air space.

All waste must be hauled away from premises each day.

Each floor should be kept separate by fire doors to avoid drafts.

Have sheet-iron cupboards with doors and latches for the handling of clothes for each man.

Electric Equipment

All electric wires must be drawn tight. See that the porcelain cleats are in perfect condition and insulation is in good shape on all wires. Where wires go through partitions or walls, wire should be reinforced by using fire-proof tubing or porcelain tubes. All electric wire joints must be brazed or soldered where connection is made. Lamp cords must not be hung on nails or wrapped around piping. Paper shades must not be used. Lamps must not be suspended by light twine.

Fire doors and shutters must be closed every night. Stocks must not be in the way to hinder the ready closing of these fire doors.

Warn the Watchman

Instruct the watchman that if fire should occur prompt action must be taken, and impress upon him the importance of keeping cool.

Each foreman to inspect his department at quitting time each day and see that everything is left in good order.

Each foreman to go over these items carefully, and see that these instructions are carried out, and report to the office or superintendent if anything is lacking.

Make an appointment with your night watchman once every thirty days for a fifteen minute talk regarding the condition of the factory; he may offer some suggestions of benefit.

Inspection

Issue instructions to each foreman four times a year, on the 1st of July, October, January and April, cautioning them to keep everything in order, and see that all fire apparatus is in the best of condition. It will not take fifteen minutes a day four times a year (total one hour) to dictate these instructions to the stenographer. Go a little further, and issue, the first of every quarter, an order to your superintendent to go with you on an inspection trip to see for yourself that everything is in good shape. These few hours that you put in each year will not be noticed, but will be of great benefit and will be a good system.

I am pleased to say that no serious injuries or fatalities have been reported to us during the past year through fires.

Inspector A. W. Holmes in his report says:—"The machinery used in woodworking factories on account of the high speed at which they operate is easily among the most dangerous of all, but the last few years have seen great strides towards the protection of all these machines. The greatest difficulty the Inspector has to contend with in these places is not the installing of guards, but getting the operator to use them. A few weeks ago I was in a woodworking factory to investigate an accident, where a man lost part of his finger. In talking to the foreman about how it happened, I learned that guards were

provided for the machine but not used. The foreman said that he never saw the machine he would use a guard on. I replied, "You are the man responsible for the loss of the finger and should be made to pay for it. The employer has provided the guards, and it is part of your duty to insist on the men using them both by example and advice." However, before leaving him he admitted the soundness of my argument, and promised to use and insist on others using the guards in future. All machinery is dangerous, and no liberties should be taken with it."

The following table shows the causes of the accidents in saw mills and paper plants during the year:—

Lumber	
By falls	2
By saws	7
By buzz planer	6
By falling substances	2
By gears	1
By emery stone	1
By edger	2
By elevators and hoists	1
By crushed by logs	1
By electricity	1
By belts	2
By unspecified causes	1
Smothered	1

Paper and Paper Trades

By paper-cutting machine	1
By elevators and hoists	2
By burn, friction and fire	3
By presses	5
By corner cutter	1
By cogs	1
By saws	1
By calanders	2
By shafting	1
By parafining machine	1
By falling substances	2
By belts	1
By corner staying machine	4
By pulleys	1
By falls	1
By grounding machine	1
By embossing machine	1
By printing	2
By hoists	1
By zinc plate	1
By hand tools	1
By shears	1
By ending machine	1

Referring to the Districts of Algoma and Nipissing, Inspector Holmes says:—"I found the condition in the saw mills on the whole very good. There is always room for some improvement, which the owners of the mills seem pleased to know, and promised to comply with same. One pleasing feature of my inspection trip was that in only one place was any child labor found, and they were far removed from the mill, carrying and piling staves. The subcontractor claiming that on account of school holidays, he was permitted to hire them. They were sent home, and the firm warned not to transgress in the future. This was the only case where boys were found under age. The number of industries throughout this large district is increasing very rapidly."

Canadian Timber Exhibit in England

Western Australia has taken energetic steps to attract attention in England to its timber resources. A display of Western Australia timber is one of the prominent features of the Liverpool Industries Exhibition. The annual value of Western Australia timber exports is about \$5,000,000 and special efforts are being made to increase this total. The example of Western Australia might profitably be followed by the Dominion of Canada or by the various provinces. Instead of sending samples of the forest products in the rough, as has been the custom on many occasions in the past, exhibits of Canadian timber resources should consist of the dressed and finished product, such as doors, sash, ceiling, flooring and other interior finish. A permanent exhibit in the Old Country of this nature which could be moved about to the different industrial exhibitions should prove an important factor in developing Canadian trade. This would apply especially to the province of British Columbia, the product of whose forests are seriously handicapped by the heavy freight rates for shipments across the continent to the Atlantic this handicap will shortly be lessened greatly by the opening of the Panama Canal and the opportunity for demonstrating in a practical manner, the value of these Canadian products, will be an exceptionally favorable one.

Slash Burning a Profitable Business

Fire Risk Greatly Reduced—B. C. Forestry Department assisted by Loggers
Making a Study of Results and Costs

The efforts being made by the B. C. Forest Branch of the Lands Department to interest lumbermen, contractors and others in preventing forest fires are meeting with encouraging success. A recent step in this direction consisting in the sending of a circular letter to all loggers in British Columbia, calling their attention to the importance of burning slash.

There is no law in British Columbia requiring loggers to burn slash on logged over land. There are, however, regulations of the Forest Branch and of the Department of Railways requiring contractors to burn all slash resulting from their operations whether right of way clearing, road construction or tie cutting. It was observed by the Forest Branch during the past few months that, where railway contractors burn their slash according to instructions of the Forest Branch, excellent fire protection was secured at very little cost or trouble. The lumbermen were then asked to co-operate with the burning of such slash as had recently resulted from their operations.

Since the sending out of this letter quite a number of the more important companies have burned their slash and have, at very little expense to themselves, greatly decreased the fire danger to their remaining timber.

Information is now being gathered by the Forest Branch as to the actual cost of slash burning in different sections of the Province, and it is hoped that when this information is made public it will encourage a larger number of the operators to burn their slash this coming Fall.

The letter sent to loggers referred particularly to slash burning during the spring. The valuable information which it contains however will be of use in the Fall also. For this reason we reproduce it herewith:—

Dear Sir:—I wish to request for the Forest Branch your earnest co-operation in an effort to solve the problem of the disposal of the slash resulting from logging operations.

Owing to the great density of the timber stands on the coast and in portions of the interior of British Columbia, to the conditions surrounding the lumber industry which permit of the removal from the woods of only a very small proportion of the stand, and to the methods of logging, the amount of slash remaining after logging is excessive. Generally also the timber remaining after logging is without further value, and, since the slash effectually prevents the growth of a valuable second crop, slash must be removed first if the land is to be utilized in producing another crop of timber.

I need not point out that by far the greater portion of the land in British Columbia is, owing to its roughness and lack of soil, unsuited for agriculture, and the only possible way in which it can be made a steady source of wealth is by the growing of timber. Besides its effect in preventing the production of a second crop of timber, slash is universally recognized as the most serious of all fire hazards, and it is only a question of time before every slash area will be set on fire. This being the case, the evident thing to do is to burn the slash at such a time and under such conditions as will, so far as humanly possible to determine, render it certain that the fire does not spread to adjoining timber.

The Forest Act of British Columbia does not make the burning of slash compulsory although in the States of Oregon and Washington, where the

Ordinary Slash a Dangerous Fire Trap

conditions are identical, such laws are in effect. The Forest Act does, however, empower the Minister of Lands or the Forest Board to require owners to construct a safe fire-break about any area of slash, and where necessary to protect valuable timber this provision of the Act will be enforced.

To be at all safe or effective against July or August fires, fire-breaks must consist of a strip 5 to 10 feet wide cleared to mineral earth and a strip 10 to 30 feet wide cleared of brush, inside which all dead snags standing within a distance of 100 feet must be felled.

As long as the slash remains, however, the danger from fire is still serious, and it is felt that it would be far better to burn the slash itself than to construct such fire-breaks, the cost of which is as much or more than that of slash burning.

A number of loggers in British Columbia have already adopted the practice of burning their slash every year either in the spring or in the Fall, and I hope that you will decide to apply the plan to your operations and take up the matter immediately with your superintendent.

During April no permit to burn is required, and after May 1st permits can be obtained from the local forest officers. While it is impossible to specify the conditions as to weather when burning can be done safely, or the methods by which the burning can be most effectively accomplished, these matters being best determined by your superintendent, the following general rules may be of assistance:—

(1) Always construct a trail or a light fire-break around the slashed area before starting fires. This will serve to confine the fire and also permit men to get around the fire quickly.

(2) Be sure and have enough men on hand when you start a fire to control the fire if it threatens to spread beyond the slash.

(3) Never start a fire in the morning unless you feel certain a strong wind will not arise. The best time to start a fire is after 4 o'clock in the

Slash Burning Makes Safe Logging

Piled Slash reduces fire risk

afternoon on a calm day; if the weather is warm and the slash dry all the better.

(4) If the slash area is surrounded by timber start fires first on the leeward side if there is a breeze, or on the uphill side if on a slope. When the danger of fire spreading beyond the area to be burned is past, set fire on the windward side or at the base of the slope; also whenever possible take advantage of a breeze blowing away from green timber.

(5) Burn over the area as quickly as possible. This can be done by starting fires in a large number of places.

(6) Keep a watchman on the area burned until all fires are out. Cut down any snags which may be burning. All fires should be completely out before June 15th.

Experience has shown that slash can be burned safely at the cost of 5 to 20 cents an acre, and that this expense is fully repaid by the resulting added safety of the camps, equipment and surrounding timber. The cost can be materially reduced if the policy of annual burning is definitely adopted, since by a little forethought the superintendent and foreman can arrange to have drag and skid roads serve as fire-breaks. When it is known where the boundary of an area to be burned will be, it is also a material help to have the trees felled away from the green timber.

I would appreciate it very much if you would report what action you take, if any, with respect to burning your slash, giving the area burned, the weather conditions, methods of controlling the fire, and the cost. At the end of the season this information will be collected in the form of a bulletin and mailed to all the lumbermen.

It is also desired that the owners of timber be prepared to discuss the subject thoroughly at the International Fire Protection Convention, which will be held in Vancouver next December.

Northern Ontario Suffers from Forest Fires

Alarming reports of forest fires in Northern Ontario were received during the first three days of the present month. A prolonged period of dry and very hot weather had prevailed and everything was ready for a disastrous conflagration. The district in the neighborhood of the Transcontinental and the T. & N. O. Railways was seriously menaced, fires springing up in all directions and threatening to join forces. The town of Earlton about 26 miles from Cobalt was wiped out by fire on June 29th. The loss included two hotels, two saw-mills and a number of other buildings. At that time the whole country from Thornloe to Cochrane was in danger. Reports received on July 1st stated that the whole of the Temiskaming country was ablaze with forest fires. Even around the settled towns of Cobalt, New Liskeard and Haileybury much apprehension was felt.

On the afternoon of July 1st a slight rain fell at Cochrane which lasted for ten minutes and put out the fires in that neighborhood. This gave some rest to the fire fighters, but would have been insufficient to prevent the impending destruction. Reports from Jacksonboro, a short distance west of Cochrane, where Jackson & Tindle have their operations, states that 100,000 sawed logs representing a year's work were destroyed. At Cochrane, the saw mill and yard of McKnight and McKinnon were in danger for a long time. Only a fortunate turn in the wind saved this plant.

After July 1st the weather again became excessively hot and dry and the struggle had to be started once more by practically all the people living in the north country. By July 4th the flames were as threatening as they had ever been. The weather was close and hot and a stiff wind was assisting the flames greatly. Late in the afternoon however, a heavy rain-fall commenced which put a check on the fires in practically all parts of the country. No loss of life is reported from any settlements. Many reports have been received however, of the great hardships endured by those who had to fight the flames and in many cases had to fly from them, leaving all their possessions to be destroyed.

Recent reports from Cochrane state that the large new mill being erected by Jackson & Tindle, at Jacksonboro, was destroyed. This report had not been confirmed up-to-date. Of the spruce and pulp wood wiped out at various points it is estimated that one-third belonged to the government and two-thirds to settlers or land owners. A large amount of fire-swept territory belongs to veterans who received it in land grants.

Graves Bigwood Plant Progressing

Graves, Bigwood & Company, Limited, Toronto, report that they are making good progress in connection with the erection of their new mill at Byng Inlet, Ont., to take the place of the one that was destroyed by fire last year. In re-building their mills, the company are putting in an extensive rail transfer system on their trams. They are therefore, discarding the trucks which are thereby displaced and those which are in excess of their requirements for regular shipping. Rails are being laid on the upper deck of their trams by which means the lumber will be distributed all through the yard. Shipping will be done however, as heretofore, on lumber trucks on the lower decks of the trams. These arrangements afford great flexibility in the equip-

ment and contribute materially to the company's facilities for prompt and varied shipments. All lumber will be loaded from the piles on to the detachable lumber trucks, and hauled to a central loading point, when shipped in the rough; or to the planing mill when shipped dressed. In their advertisement, which appears elsewhere in this issue, Graves, Bigwood & Company draw attention to the lumber trucks which they are discarding and are offering for sale. These trucks are well suited for use in and around retail lumber yards.

Abitibi Company's Good Prospects

Property Shown to be Well-Watered and Easily Operated—Interesting Details Regarding the Plant

An interesting illustrated report upon the Abitibi Pulp & Paper Company, Limited, which has recently been issued contains much information regarding this undertaking. The area embraced within the pulp limits is 1,560 square miles or about one million acres. The distance by water from Lake Abitibi to Iroquois Falls where the plant is located, is approximately forty miles, and in this distance there are three excellent water powers capable of developing a total of over 50,000 h.p. At Iroquois Falls, five hundred acres of land have been reserved for mill site and water power development. The company report that examinations show the limit to contain millions of cords of pulp wood, principally spruce of the best quality for pulp and paper manufacture. The entire territory is well watered and every square mile can be economically logged. The close proximity of the timber to the mills, good driving streams, short drive, and the ease and cheapness with which supplies can be taken into the lumbering camps, enable the company to deliver wood at the mills at a very low cost. In addition to the very large supply of pulp wood on the company's limit, the pulp wood cut by settlers in clearing their lands is valuable to the company and this can be exported to the United States markets free of duty.

Power Development Plans

The initial development of power will be 21,500 h.p. which is being produced at Iroquois Falls. Referring to the various sources of profit the report states that in addition to the revenue from pulp and paper plants the company will derive a considerable income from lands, from lumber-manufacturing businesses and from the sale of surplus electric power. The company propose to install nine pairs of water wheels, each pair in a separate flume for driving pulp-grinders. Each of these pairs of wheels will be direct-connected to two wide grinders. To the east of these grinder flumes will be two more flumes each with a pair of wheels, duplicates of those for grinders. These will be direct-connected to electric generators for furnishing power to drive all equipment except the grinders and for light. Each of the pairs of wheels will be capable of generating 1500 h.p. or a total of about 16,500 h.p. for eleven pairs. Only fifteen of the eighteen grinders will be required continuously to maintain a production of 150 tons per day. Ample provision will thereby be made for necessary shut-downs. The grinders will be equipped with stones 36 inches wide capable of taking pulp wood 32 inches long. Five saws will cut sixteen foot logs into six pieces of equal length. A double arrangement of all pulp machinery is adopted and each side is a complete unit in itself with a shipping track between them and within the building, so that cars can be loaded at all times under cover.

The entire mill and yard, including the wood storage pile will be equipped with an approved fire protection system, consisting of automatic sprinklers for the buildings which have combustible structure or contents and hydrants with hose houses through the property. An elevated fire tank on tower, constantly full, will provide pressure at all times. In addition there will be provided a fire pump in a separate building.

Mr. George F. Hardy, who is designing the mill, recommends that a temporary sawmill should at once be erected at Iroquois Falls to manufacture the lumber necessary for temporary structure purposes.

It is estimated that a fair conservative figure for the cost of pulp wood from the company's limits, delivered in the booms at the pulp mill will not exceed \$4 per cord including government charges and that the pulp wood secured from settlers can be purchased for considerably less.

According to the report of Mr. Hardy, most of the machinery required can be obtained in Canada. So far as this is practicable, he recommends such a course, so as to bring the company into close touch with points of manufacture for necessary repair parts. Prices for Canadian-made machinery of equal merit, he reports, rule about the same as the prices for machinery made in the United States plus the Canadian customs duty.

The report of William Whyte upon the company's timber property shows that the various townships contain pulp wood averaging in some cases thirteen to fifteen cords to the acre and in others six cords to the acre. Other townships reported upon contain on the average eight and ten cords to the acre.

Free Lumber Will Have Little Effect

Canadian Product in United States Markets will not Have Serious Influence
one Way or Another—An Interesting Analysis

One of the most frank and searching analyses of the new United States Tariff Act, so far as it affects lumber interests, is contained in a letter from Robert E. Vestal, of Toronto, recently published in the Southern Lumberman. The Canada Lumberman has refrained from publishing much more than the actual views upon this subject, feeling that it was the better and more dignified course to allow our neighbors to deal with a matter so entirely their own, without offering them any extraneous opinions. The views of Mr. Vestal, however, have a peculiar significance—being the views of a man who knows something of the situation both in the United States and Canada. He was formerly a prominent hardwood operator in Tennessee, but is now in the lumber business at Toronto. In his letter on the effect of free lumber, Mr. Vestal says:—

"Our democratic tariff revision bill having passed the national house of representatives, a great number of people, not a few of whom are connected with the manufacture of lumber or its ultimate usage and trade, are asking the question, 'What effect will this have on the lumber industry of the United States?'

"The probable reason for this interest is the fact that since the days of the Wilson tariff bill, passed during the democratic administration of President Grover Cleveland, and its repeal under the Republican administration of President William McKinley, the lumber press, with many news publications, have published many thousands of words of argument to show the dire straits to which the lumber industry of the United States would be reduced if free lumber from Canada should again become a law.

"Probably the most violent opponents of free lumber from Canada have been the manufacturers of long and short-leaf yellow pine, and their argument has been reiterated over and over again, that there was more lumber produced in the United States than consumed; that the box trade for long and short-leaf pine would be annihilated by the cheap box material from Ontario and Quebec.

"American lumber enters Canada duty free, when in the rough, or dressed on one side. Canadian lumber entering the United States in the rough pays a duty of \$1.25 per thousand (except basswood and silver poplar, which pay a duty of 50 cents per thousand).

"Let's see how this works out: Canada buys from Uncle Sam per annum some three hundred million feet of long and short-leaf yellow pine, value, f.o.b. mill, six million dollars; about sixty million feet of oak, about thirty million feet of cypress, gum, poplar, ash, walnut, fir, mahogany and of all other woods, value of the whole, f.o.b. shipping point, three and one-half million dollars. The fir enumerated above comes almost entirely from the state of Washington.

"Basswood and maple from West Virginia are shipped freely into Ontario, and the State of Michigan furnishes to Ontario as much hard maple as is produced in Ontario proper.

"Bill stock in short lengths, 10 to 16 feet, in hemlock, spruce and pine, is manufactured to considerable extent in Ontario and Quebec, but no lumber dealer would attempt to fill an order for bill stock longer than 16 feet or larger than 8 x 8, except at yellow pine prices, and in nine cases out of ten would supply yellow pine.

"To be specific, one American concern located in Cincinnati, O., has since January 1, 1913, shipped some 400,000 feet of hemlock 2 x 4 to 2 x 12—10 to 20 feet, and a like amount of short-leaf yellow pine, same dimensions, from their mill in Tennessee to a retail yard in the city of Toronto. Surely, then, the manufacturer of hemlock in Pennsylvania and the yellow pine producer will not be forced out of business by a flood of cheap lumber from Canada because of the removal of a duty of \$1.25 per thousand feet. The average cost of production of lumber of all kinds in Canada today is in the neighborhood of \$22.50 per thousand, including stumpage. The duty, therefore, is only about 5 per cent. on the f.o.b. mill cost of production.

"Let us see about box lumber. No. 1 mill cull white pine (about equal in grade to No. 3 common poplar) is selling today, f.o.b. mills, on Georgian Bay, for \$21.50 for random widths and \$23.00 for 10-inch and 12-inch stocks; No. 2 mill cull (about equal to No. 4 common poplar), \$16.00 for random widths and \$19.00 for 10-inch and 12-inch stock. Surely this will not put the manufacturer of yellow pine box lumber in Georgia or Texas out of business.

"There has been another argument used against free lumber from Canada. Cheap lumber, principally fir, from British Columbia, manufactured by cheap Hindoo labor, would ruin the market. The Hindoo is the negro labor of the Canadian Pacific coast, but as well paid as any saw mill labor in the South, and white labor in British Columbia receive for the most common labor \$3.00 per day. Cost of transportation is what keeps fir from Oregon and Washington at home, and the province of British Columbia, in Canada, from being

no greater competitor of yellow pine, and not the small duty imposed by the United States Government against this wood when manufactured in Canada, where the cost is more than in Washington and Oregon, as our mills are older and better equipped, and our transportation facilities much more favorable to the producer than those in British Columbia.

"When the Panama Canal is opened, if the dream of cheap transportation from Seattle, and Vancouver to our Atlantic seaports and the Old World is realized, then lumber from the Pacific coast will be a competitor in the markets of the east and in Europe, but with the every-day reduction of real long-leaf yellow pine stumpage of any size, will only tend to supply a need in large and long timbers, and not to cripple any industry that is prospering today.

"I was speaking to a manufacturer of yellow pine from St. Louis a few days ago. He has always been greatly opposed to free lumber from Canada. I brought up the subject, but all the satisfaction I could get from him was: 'We have discounted that and forgotten about it.' Another yellow pine manufacturer gave me this answer: 'I do not claim that it will hurt our business, but the government might just as well continue to collect the duty and add that much to its revenue.' Those who go on this idea, however, should remember that there are a host of American manufacturers of lumber in Canada, and it is the American manufacturer and dealer much more than the Canadians who ship lumber to the United States. The Canadian manufacturer depends more on the local market and is selling to the exporters for forwarding abroad via Montreal, Halifax and St. John. It should also be remembered that there has been a growing situation in Canada for a number of years among a certain class for a duty on yellow pine lumber from the United States. With the markets of Canada absolutely free to the American manufacturer and dealer, it would seem that the present duty as imposed was obsolete and that Congress has done the right thing in admitting free lumber from Canada.

"To sum up the situation, as to what effect this will have on the lumber industry of the United States, it appears to me like this: If one of our good prohibitionists down in Nashville should declare that he would never, never take another drink and would take his quart of "Jack Daniel" or "Cascade" or whatever it might be and pour the contents of his bottle into the Cumberland River, this misused quart would have about as much effect upon the Cumberland River as free lumber from Canada will have upon the lumber industry of the United States."

Successful Forestry Convention at Winnipeg

The Canadian Forestry Association held an interesting convention at Winnipeg on July 7, 8 and 9. This is the first time that the convention has been held at Winnipeg, so that the subject of forestry was looked at from a somewhat different angle than when the conventions were held in the timber provinces and Eastern Canada or in British Columbia. In this connection it was interesting to note that Mr. R. H. Campbell, Dominion Director of Forestry in an address entitled "Manitoba, a Forest Province," showed that the aggregate timber wealth of Manitoba and the two other prairie provinces is immense.

The important subject of fire protection was dealt with in papers prepared by Mr. George Bury, vice-president of the Canadian Pacific Railway, Mr. Clyde Leavitt, Chief Fire Inspector for the Board of Railway Commissioners of Canada, Mr. H. R. MacMillan, Chief Forester for British Columbia, and Mr. E. H. Finlayson, Inspector of Fire Patrols on western railway lines for the Dominion Forestry Branch. The range of subjects covered at the Convention was exceptionally wide, including those mentioned above, as well as discussions upon the influence of forestry on the trade of Canada as a whole; insect problems in Canadian forests, the rate of tree growth, the management of farm hedges, the work of the tree planting division of the Dominion Forestry Branch, forestry progress in Ontario, the position of the railways in connection with forest protection, and brush disposal in lumbering operations.

Canadian National Exhibition

The new Livestock Department at the Canadian National Exhibition will give splendid accommodation for the fine animals for which the Big Fair is noted. It also adds a finish to the appearance of the grounds more than anything else has done. The Exhibition City with its \$2,500,000 worth of buildings, its paved streets and its lighting plant of 40,000 lamps has no rival on the American continent.

Personal News of Interest to Lumbermen

Edwin B. Cadwell, formerly chairman of the board of directors of the Canadian Puget Sound Lumber Company, has succeeded S. W. Barker as general manager of the company.

G. E. Raven, the new superintendent of the cedar mill of the Canadian Western Lumber Company, was formerly with the Case Shingle & Lumber Company, Raymond, Washington.

S. W. Baker has resigned the general managership of the Canadian Puget Sound Lumber Company, Victoria. His successor is E. B. Cadwell, who was chairman of the board of directors.

Mr. A. G. McIntyre has resigned the secretaryship of the Pulp and Paper Association on his appointment by the Federal Government to investigate certain phases of forest conservation.

Sir William MacKenzie and a party of Canadian Northern Railway officials together with Messrs. A. Smith and Noel Marshall of Toronto recently inspected the large pulp mills at Fort Frances and International Falls as the guests of Mr. H. Backus.

George D. McKay, superintendent of the British Columbia timber inspection office recently made a tour up the coast and on his return reported that the prospects among the loggers were never brighter than at present. The shortage of money reported in the cities does not seem to be having any effect on the logging operations.

Robert S. Hall has been appointed superintendent of the Jonquiere Pulp Mills at Jonquiere, Que., succeeding Joseph Porritt, general superintendent, resigned, and has entered upon his new duties. Mr. Hall has had an extended and thorough experience in mills in Canada and the Old Country and has been with the Jonquiere Company about three years.

The C. P. R.'s first forestry work in New Brunswick has been commenced. Mr. Kenneth Vavasour, of Fredericton, is in charge of the party, which began work in the vicinity of McAdam Junction, and Professor R. B. Miller, Dean of the U. N. B. Forestry School, has opened his summer's work in the interests of the company. Another party of forestry workers have gone to the Nipigon country in Northern Ontario.

Mr. J. K. Ockley, manager for the Seaman-Kent Company, Fort William, Ont., and Miss Tina Gray were united in marriage, at Meaford at noon, on Wednesday, June 25th, and left immediately on an extended wedding tour, to Montreal, New York and Eastern points. On the eve of Mr. Ockley's departure from Fort William the members of his staff made him the recipient of a beautiful present, as a token of the high esteem in which they hold him. A pleasing and appropriate speech of presentation was made by Mr. F. E. Kenzinger, assistant manager.

Price Bros.' New Mill Manager

Mr. William D. Gregor, general superintendent of the Kenogami Paper Mills, has been appointed mill manager for all of Price Bros.' mills for Kenogami and Jonquiere. Mr. Gregor came to Canada last fall from the United States where he occupied an important position as general superintendent of the Oxford Paper Company at Rumford Falls, Me. He has been at Kenogami during the completion of construction and opening of the paper mills there as general superintendent. On account of the resignation of Mr. Porritt, Mr. Gregor has been appointed mills manager. He started his paper-making career with R. Sullis & Company, Markinch, Fife, Scotland, and went with them through the various departments up to backtending on machine. After three years in Dalmore in a more or less similar capacity he went to the Guardbridge Paper Company, Fife, and enjoyed for over six years, perhaps the most useful experience to be obtained anywhere. Eight years ago he came to the United States, where his career was quite successful, being appointed after a year's service with the Oxford mill at Rumford, Me., under Hugh J. Chisholm, whose energy made that mill second to none, superintendent of the paper manufacturing department. During this period the capacity of the mill was increased by the addition of four paper machines, increasing it from 80 to 155 tons per day of magazine, card, litho, table, writing and high grade book papers. After four years he was advanced to the position of general superintendent of the entire plant, making 90 tons bleached sulphite, 112 tons bleached soda pulp, and 155 tons of paper per day. Mr. Gregor's many friends wish him all success in his new appointment.

Mr. Edward Flynn, formerly office manager of the Jonquiere Mills, who resigned about two years ago to go to Montreal, has returned to Price Bros. as office manager for the two mills at Kenogami and Jonquiere.

Reports from Sutton, Que., state that the Escanaba Veneer Mill Company is not likely to re-build the mill which was recently destroyed by fire at that place. It is expected that the new mill will be located near Glen Sutton, so as to be nearer the company's hardwood timber.

Ontario Lumber Salesmen

Men Who Keep the Stocks Moving

W. G. Paynes, Toronto

W. G. Paynes, Toronto.

Of late weeks the visits of travelling salesmen to the various retail yards and other centres of lumber consumption throughout Ontario have not always been as profitable as they were a few months ago. Salesmen have been in the habit of returning on Saturday to their headquarters and reporting in a confidential manner to their chiefs that "something is the matter" with trade, as they have to work twice as hard as usual in order to obtain about half the customary quantity of business. Without attempting to analyse this peculiar situation, for which everyone has his own individual explanation, it is worth while noting that there are some decided exceptions to the rule. It may be that the salesman himself has a certain way which obliges his customer to hand out his money. It may be simply luck. It may on the other hand be a combination of these circumstances and of that successful and minute attention to business which characterizes such men as Mr. W. G. Paynes, the widely known representative of the firm of Campbell & Johnson, Toronto. Whatever the cause, one is certain, on a Saturday morning to find Mr. Paynes joyfully relating to Mr. Campbell the results of a good week's business.

Mr. W. G. Paynes was born in England in 1876 in the County of Surrey and came to Canada when he was thirteen years of age. His schooling was secured at the public and high schools of Simcoe, Ont., after which he devoted himself to a consideration of the ways and means of securing a good livelihood. For the time being he settled upon the calling of a school teacher. This was a temporary arrangement only, and did not appeal to Mr. Paynes as promising any considerable advancement in the future. At the first opportunity he gave up teaching and found a position in the office of the Turner Lumber Company at Midland, Ont. Four years with the Turner Lumber Company put him in a position to look around for bigger things and he found his opportunity at that time with the Toronto office of the Turner Lumber Company in whose employ he continued for four years more. Thus equipped with a knowledge and experience of both the shipping and the office end of the business Mr. Paynes cast about for an opportunity to go on the road and round up his lumber education by securing a knowledge of the task of converting lumber into money.

Just about this time the firm of Campbell & Johnson was on the look out for a bright young man with an ambition to make money and to increase their profits. They lit upon Mr. Paynes, made an agreement with him and launched him as a salesman. The proposition was one which has turned out successfully for all concerned. Mr. Paynes has proved himself not only a good salesman, but a keen student of market conditions and of all the other elements that are important in the education of a salesman. In identifying himself with the firm of Campbell & Johnson he enabled them to maintain and increase their enviable reputation and at the same time he secured an opportunity for which he had amply prepared himself and which he has succeeded in realizing successfully.

East Kootenay Company Operating New Planing Mill

The East Kootenay Lumber Company, of Jaffray, B.C., have their recently improved planing mill in good working order. All products are now manufactured from dry material and loaded direct to cars from planing machines. Thus customers receive clean, well manufactured and well graded material. From their long experience in manufacturing, they find that a good product cannot be produced from common lumber when dressing is done in the green state. By the use of fast feed machines and round cylinders the amount of down grade caused by milling defects is reduced to a minimum in the dry dressing process. Their three hundred foot sorting table gives them a splendid opportunity to grade their lumber to the best possible advantage.

News of the Trade From Eastern Canada

Important United States Company Opening Operations in Quebec Province—
Fassett Lumber Co. to Rebuild—Quebec timber measurements

The Fassett Lumber Company, Limited, Quebec, P.Q., report that the fire at their plant on June 23rd caused damage in the neighborhood of \$125,000, nearly all of which is covered by insurance. The fire started at 3.45 a.m. and the cause is still a mystery, as the watchman was in the mill at the time making his rounds. The flames commenced in the boiler room. They spread so rapidly that before the company could get its pumps in operation, the mill was on fire. The destruction included the sawmill, planing mill, shingle mill, oil house and store house, with contents. The company's electric light system and large engine, together with the pumps were ruined. At the time of writing, the company believed that their boilers had only been slightly damaged. They also reported that as soon as the insurance could be adjusted they intended to go ahead and install a new plant.

C. H. Swift & Sons open Sherbrooke Office

C. H. Swift & Sons, Limited, Sherbrooke, Que., notice of whose incorporation was published in the Canada Lumberman of July 1st, report that they will carry on in Eastern Canada the same class of business as the name of Swift has represented in the field of hardwood in New York State and New England for the last twenty-five years. The firm of C. H. Swift and their predecessors have carried on extensive milling operations in the Adirondacks and have always catered to the high grade trade, specializing in piano stock and red birch trim. For the last four years they have, through their general wholesale operations become known throughout the eastern townships as "the American Market." They handled 5,000,000 feet of Canadian birch last year, most of the high grades of which went across the line to be used in pianos, while the low end was absorbed in the flooring requirements of Montreal and the Eastern Townships.

The firm have recently purchased 9,000 acres of high class timber lands in Eastern Canada which will be operated by the Canadian company. This company has a capital stock of \$150,000, and includes Mr. A. C. Bissell, of Sherbrooke, P.Q., who is widely known in the spruce and pulp wood business of Quebec and who has a reputation as one of the best sawmill operators in that province. Under these conditions the company will be able to manufacture the same class of high grade stock as that upon which they built up their reputation in the Eastern States. During the coming winter they will put up 2,000,000 feet of high grade logs and expect to work up their low end in the various by-products which accompany modern lumbering operations. Their mill is located at Long Swamp, on the main line of the C. P. R. In addition to operating this mill they will handle cuts from various other mills according to their former practice. Their head office will be at Sherbrooke, P.Q., and the officers of the company are as follows:—President and general manager, C. H. Swift, Jr., Utica, N.Y.; vice-president, A. H. Swift; treasurer, A. C. Bissell, Sherbrooke, P.Q.; secretary, F. S. Rugg, Sherbrooke, P.Q.

Increasing Trade at Cabano and Edmunston

The United States Consular and Trade Reports in a recent issue refers to the lumber industry at Cabano, P.Q., as follows:—The district of Cabano is dependent altogether upon the lumber industry and practically upon a single corporation, Donald Fraser & Sons, Limited, which owns large mills and extensive timber limits in the vicinity. These mills are equipped with up-to-date machinery, four of the latest improved planers (with individual electric motors attached) having recently been added to their plant. Each of these machines is capable of turning out 15,000 feet of dressed lumber (planed, tongued and grooved, and beaded) per day. Resawing is done with improved bandsaws, while the filing and grinding machinery is of the latest patterns. An Indianapolis dry kiln has recently been installed, having a capacity for thoroughly seasoning 60,000 feet of lumber in 24 hours. The value of lumber in its various manufactured products exported to the United States from the Cabano district has increased from \$443,387 in 1908 to \$897,906 in 1912, or more than doubled in value in four years. The Fraser Company formerly exported a considerable percentage of its manufactured products to Great Britain, but nearly all now goes to the United States.

There is every indication that the increase in exports of lumber to the United States in 1913 will exceed that of 1912, as preparations have been made for a larger number of logs to be driven down into Temiscouata Lake than ever before, and a large number of logs will also be cut on the headwaters of the Temiscouata and tributary

streams and shipped by rail to Grand Isle, Me., where they are manufactured into merchantable products.

There has been a remarkable increase in the business of the Edmundston, New Brunswick, Consular agency since 1908. During the first year the declared exports to the United States were valued at \$683,489, compared with \$1,164,211 for 1912. The opening of the International Railway, which runs from Campbellton to St. Leonard, has contributed largely to this increase, and when the Transcontinental Line is complete Edmundston will become a distributing point for lumber shipments to all New England points.

The exports of dressed lumber to the United States for 1912 show an increase in value of \$230,588 over 1911, due principally to the opening of a rich timber tract along the line of the International Railway. Previous to the opening of this road logs cut along the route were driven down the small streams tributary to the St. John River to the mills in Maine. This operation was expensive, some of the timber requiring two years to reach its destination. Last spring, however, the experiment of shipping the logs by rail was tried, with the result that the entire cut of the season was delivered by train directly to the mills.

Quebec Timber Measurements Report

The following comparative statement of timber measured and called to date is furnished by the Quebec Supervisor of Cullers under date of July 8th:—

	1911 Cubic Feet	1912 Cubic Feet	1913 Cubic Feet
Waney white pine	440,720	227,280	121,400
White pine		80	40
Red pine	6,240	1,320	680
Oak	14,120	10,000	47,680
Elm	158,960	200,520	163,920
Ash	80	120	840
Birch and Maple	58,800	38,640	47,680

Will Erect Sulphite Plant on Anticosti

A large number of the members of the Montreal Board of Trade and their friends participated in the annual trip of the Board this year. The party visited Anticosti, the island owned by M. Menier, and afterwards went up the Saguenay as far as Capes Eternity and Trinity. M. Menier is spending a large amount in developing the resources of Anticosti, and is exporting quantities of pulp wood. Mr. Martin-Zede, the Governor, in the course of an interview, denied that he was simply stripping the island of pulp wood. "We have," he said, "cut only the larger trees, leaving the others to grow up. In this way we plan to have a perpetual supply. And the portion we have cut over in this way is so small that if you were to take a map of the island and prick it with a pin, that pin-prick would represent the cut portion. We do not intend to continue to export the wood. What we have done so far is to make an experiment with a view to seeing if we could land 50,000 cords of pulpwood at tide water every year. We have demonstrated that we can do this. Our intention now is to erect a large plant for the manufacture of sulphite pulp. When the railway to Gaspé is completed, we shall be able to ship it out by that line, for it is only 60 miles from Anticosti to Gaspé."

Forest Fires Destroy New Brunswick Timber

Crown Timber Lands and Private Timber Lands in the province of New Brunswick suffered seriously from fire during the last week of June and the first week of July. The month of June was exceptionally dry. The worst fire in the province was reported from Cedar Brook, Victoria County, where, over 5,000 acres of timber lands were burnt over and a logging camp owned by J. D. McLaughlin, of Red Rapids, containing about \$3,000 worth of supplies was burned. Recent reports stated that the fire fighters had the flames under control. Another serious fire was reported from the private lands of the Inglewood Pulp & Paper Company on Lepreaux and Magaguadavic streams east of Welsford and Clarendon.

The recent meeting of New Brunswick lumber manufacturers and limit holders which were held at St. John, was not attended by as many prominent lumbermen as it was hoped would be present. As

a result the meeting decided to postpone the taking of steps towards permanent organization, until an annual meeting which is to be held in November. No public business was attended to, although the members engaged in an informal discussion on the lumber legislation recently enacted by the New Brunswick government. As the bonus question still remains open, no definite action can be taken in connection with this matter.

Lumber Matters in the Law Courts

Suing Ex-Minister of Lands for Trespass

A writ has been filed by the Emerson Lumber Company in the Supreme Court of British Columbia for \$60,000 damages from the Hon. Price Ellison, for trespass and wrongful interference with the plaintiff's logging operations on the part of the defendant, who was then Minister of Lands. Evidence presented by Messrs. Andrew and Chas. Haslam was to the effect that the Emerson Company had been violating the manufacturers' act by exporting logs to the United States from their timber limits on Eden Island, B.C. On the strength of this evidence the Minister of Lands cancelled the logging company's license.

Logs in Stream Damaged Mill

In the Court of Appeal, Montreal, judgment has been given in the case of Pepin v. Villeneuve and others. The plaintiff is the owner of a saw mill on the banks of the Riviere aux Mulets, county of Terrebonne, P.Q., and the defendant company carries on a lumber business. The claim was for damages caused to the plaintiff's mill by logs which formed a jam while floating down the river. In breaking the jam with dynamite considerable injury was done to the mill. Defendants held they had a right to float logs down and that the plaintiff's mill constituted an obstruction. The court awarded Pepin \$400 damages, \$200 of which was withheld, as the mill constituted a partial obstruction.

Westholme Lumber Co. Brings Suit

A law suit has been commenced in the Supreme Court of British Columbia on behalf of the Westholme Lumber Company, the defendants being the City of Victoria, the Water Commission of the city, the Water Commissioner, J. L. Beckwith, mayor in 1911, Wynn Meredith, consulting engineer, and aldermen G. A. Anderson and G. Okell and Boyd Ehle, superintending engineer of the waterworks scheme. The plaintiff asks for a declaration that the Sooke Lake waterworks contract has been voided by misrepresentations on the part of the defendants. It is alleged that the defendants reported to the plaintiff that they had obtained the rights of way, the finances and the powers to enable them to construct the Sooke Lake waterworks system; that they had examined the route and had prepared estimates of cost and quantities; that they had a complete plan of the works and that the grades for the system had all been established. It is now alleged by the plaintiffs that these representations were untrue and that to protect themselves from liability the defendant had introduced clauses into a proposed contract. The Westholme Lumber Company is asking in addition to the cancellation of the contract that they be awarded payment for work already done and damages against the defendants.

Alaska Pulpwood Coming on the Market

An official report from Washington, D.C., states that large quantities of wood will be used in the manufacture of wood pulp for paper which may be expected to reach American markets in competition with the Canadian trade, following the sale of six hundred million feet of Sitka spruce in the Tongas national forest in Alaska. The spruce will be made into pulp for the Pacific Coast and Oriental trade especially. The Department of Agriculture, which controls the national forests of the United States advertised the Alaska spruce recently, saying that three hundred million feet were available. The rush of paper men to bid for this material caused the Department to double the quantity.

The latest estimates available show that there is a stand of approximately 70 billion feet on the Tongas national forest and approximately 28 billion on the Chugach national forest in Alaska. Recent investigations have shown this amount to be very much larger than was supposed. The Alaska forests, in fact, contain approximately one-sixth of the total stand of timber on the national forests. The annual cut on the Tongas forest has increased gradually from zero at its creation in 1902, until it amounted to approximately 43,000,000 feet in the year 1912. This entire amount has been cut for local uses, largely for boxes to contain canned salmon. The latest large sale is

remarkable in that it indicates a beginning of the utilization of Alaskan timber in the general markets. On the area on the Stikine River, for which bids have been received, the species to be cut include Sitka spruce, hemlock, red cedar, cotton wood and yellow cedar, and the minimum stumpage rates range from \$2.50 to \$1.00 per M.

Another Pulp Company has made application for the other area at the head of Thorn Arm, which contains the same species to be sold at similar prices. This company has had men examining timber lands in Alaska during a long period and over large areas, and has come to the conclusion that the Tongas timber offers the best opportunity yet seen. The three advantages which the paper manufacturers say they are finding in Alaska are abundant supply of timber, cheap hydro-electric power, and tide water transportation, all of these in one and the same locality. Both areas adjoin deep water, and it is probable that the plants will be so located that ocean freighters can be loaded right at the mills.

The Drop That Filled The Cup

A lumberman had invested \$55,000 all told in a new mill and its equipment. He had secured a very good Superintendent and the production had mounted steadily until they were averaging an output of about 75,000 feet per day.

Above that figure production did not go, however, but the lumberman thought nothing of that, for he considered that he was getting all that he could reasonably expect of his equipment. The Superintendent was a different sort. He had gotten into the habit of seeing more done one day than was put out the day before. He began to look for ways and means, and he found them.

He found that his matcher was idle longer than he liked every day. He also found that his moulders were not always on some job. Not that he wasn't reasonable about the matter, for he understood that changes in machine set-ups take time, and that orders must be gotten out, no matter how small they were, in a reasonable time. But, he argued, isn't it possible to cut down this non-productive time? Can't we have things arranged so that when we finish one order we can be all but ready to begin the next one? It sounded good but when he tried it, he found that the decreased non-productive time didn't amount to anything, compared to what he lost in the bad will of his men, because they thought he was driving them, and in the poor set-ups they made because of undue haste.

Set-ups were made as fast as changes of the heads and the changes of bits in some of the heads would allow, and many times the haste cost him good lumber.

This put him on another track, and he began figuring out a list of heads that would give him enough to allow of simply removing the heads required for one job and adjusting those for the next. This he figured would save him at least a quarter of the time then required, for changes.

He figured that at an expense of about \$350 or \$400 for heads he could increase his output about 25 per cent., and he took the matter to the lumberman for his approval. After some argument the lumberman agreed to send for the extra heads; but for three long months nothing new in heads appeared in the mill.

Then the Superintendent, who had a fixed habit of increasing production at every chance, went to the office. There was some talk, not all of it in whispers, and when the Superintendent went back to the mill, the heads were ordered.

The outcome, to make a long story short, was an increase of fully 33 1/3 per cent. in output the first thirty days after the arrival of all of the heads, and the quality went up markedly.

And the best part of this story is that it is absolutely true, says Berlin Quality.

Belt Practice in One Mill

What do you think of a foreman of a planing mill using common mineral machine oil on a belt, pouring it on until the belt was stringing wet, then applying two or three handfuls of resin to the greasy belt? Not only that, but calling it good belt dressing? The very fact that he was so strongly set in his own notions suggests that he was probably as far out of the way as he believed others to be, says H. W. T., in the Wood-Worker, Indianapolis. This same mill had a wire lacing machine for lacing the belts for the planers. When a belt would break, the machine man or feeder would take it to the lacing machine, cut out the broken part and lace in a short piece. Have seen as high as six or more feeders waiting at the lacer, with as many machines waiting for the belts to be repaired. The belts were nothing but pieces, and one of the joints would be coming apart each day. Taking into consideration the amount of time lost on the machines, the loss on belting, the cost of the wire lacing, and the cost of the excess labor waiting for the machines to be put into operation after repairing, there would be a large item as compared with the salary of a competent man in charge of all the belts, keeping them properly repaired, with cemented joints, with but one lacing to each belt.

THE WOODWORKER

Uneven Thickness of Lumber—The Circular Gang

Editor Canada Lumberman:

In your issue of July first, I notice a letter regarding uneven thickness of lumber. Criticism invited. Part of this letter is as follows: "We read about the great band saws and their great daily cutting capacity, but have yet to read of the lumberman advertising and guaranteeing his lumber to be even in thickness. And why not? If the sawyer can set his gauge and saw one board even, why can't he saw a thousand boards the same way?"

Now, I shall try to explain why he cannot do so. In the first place, the bandsaw, under the very best conditions, is liable to vary 1/16 inch. As the band mill wheels which carry the saw form a machine separate from the carriage, which carries the log, it becomes very difficult to make the two machines work just the same under all conditions.

Take the carriage. In the first place, there may be a little end play in the wheels, say 1/32 inch. If it is a single-cutting mill, there may be, in the offset, a variation of 1/32 inch and, in the setworks, if a large, heavy log is being sawn after a small, light one, a difference of 1/16 inch. I have often seen these variations in the best machinery that could be produced.

Now, it is not always possible even for the most expert sawyer to detect a slight variation in the boards his machine is making, but in my experience of over forty years' operating sawmills, I never yet found a sawyer who would not stop the saw and make every effort to remedy a variation of 1/4 inch. In fact, many will do so if there is a variation of 1/8 inch in thickness.

If we must have lumber strictly uniform in thickness, we will have to saw it with self-contained machines, such as the gang of saws, and not with the band mill or single circular, which are divided into two parts. There is at present being manufactured a gang of circular saws which makes very uniform lumber, the reason being that the saws cannot work if the variation in thickness is more than 1/16 inch. These machines use saws 10 and 9 gauge, 32 inch and 36 inch diameter, which take a kerf 3/16 inch.

Too wide a kerf, some will say. But let those who think so stop to consider that every board turned out is cut to a merchantable thickness and that the boards are cut 1/16 inch thinner than they could be cut on any other kind of sawing machine. Furthermore, the kerf of this saw is only 1/32 inch wider than the saw of a 14-gauge bandmill. Under the circumstances, I should think the thicker saw should get the preference. The above machine is for manufacturing lumber from logs of from 6 inches to 15 inches in diameter, or small logs.

I do not overlook the fact that the band and circular and carriage have their good points, especially in regard to the cutting of defective logs. This is too well known to call for further comment. For the cutting of large logs, any machine that cuts one piece at a run has pronounced advantages over the machine that cuts the whole log; but these advantages are not called for so much in the sawing of small logs, the quality of which attains usually a fairly high standard.

If more machines were installed to do the work, and more time were given the machines, the amount of output remaining the same, much less fault would be found about uneven sawing.

I. N. KENDALL.

System in the Mill and Yard

In choosing this subject it is not the intention of the writer to go into all of the minor details that could be discussed under this head, but to throw out a few suggestions, or hints, that may bring about some improvement over the present systems as practised in some of the woodworking concerns of today.

System should begin when the lumber reaches the yard, by having a competent man inspect and grade it, no matter what class of stock it is. No. 1 should be piled separately, as should No. 2, and so on. If it is not sufficiently seasoned, it should either go in the kiln or be stacked, with space enough between it that the air may pass freely through it, so it may dry in this way as much as possible before being worked. Of course, this applies to stock that is to be worked in the mill, and, if possible, it should be under cover. These suggestions will naturally appeal most to those who have to contend with these conditions: I will cite one of many instances that have come under my observation, says D. H. in the Wood-Worker, Indianapolis. A job came in the shop that called for No. 1 yellow pine,

thoroughly seasoned, 2-in. and 4-in. stock. The job was turned over to one of the men, who went on a wild goose chase to locate the stock. After looking all over the yard and getting what information he could from the yard men, he settled on a pile of 4 x 4 and handled every piece in the pile before he got what he wanted. Even then a good bit of it had to be cut to waste, as there were some knots in it, and it only required about 100 lin. ft. of 4 x 4 for the job.

The same trouble was experienced in finding the 2-in. stock, but it required more time, as more stock had to be handled. At least three hours could have been saved on this job with No. 1 stock piled on the yard by itself. Some may think that the task of selecting the stock should be given to the yard man, but that would not work, for several reasons. Also, the man who has the job to get out in the shop will come nearer making the proper selection in regard to quality, length, etc., than any one else.

The best system for executing shop work is to face all work on the jointer, when the length and thickness will permit. In order to do this, all stock will have to be cut to length before facing, of course, making necessary allowance for finishing. After facing, run stock through the finishing planer, then joint one edge, rip to width and joint to proper width. If the rest of the work is done in a workman-like manner, the job, when completed, will pass the most rigid inspection.

Where there is no sash sticker in the shop, this method is the only way to get out sash and doors. This, of course, applies to special work. Where there is a large amount of this work to do, sash, door and blind machinery is employed, but in the custom mills these machines are not necessary, as sash, doors and blinds can be bought from the factory much cheaper than they can be turned out in the custom mill. But, if possible, a sash sticker should be installed, as this work comes special and generally at one's own price.

I know of a firm that does not get out a pair of blinds (special size) a year, that recently put in blind machines at considerable expense. It has no sash sticker, but gets out special sash—which could be worked on a sticker with much saving in cost—every week. The blind machinery has not worked a job yet. This is evidence of a lack of proper system. The manager or superintendent pulled the wool over the firm's eyes in some way, and displayed considerable foresight (?) in this deal.

But lack of system does not stop there with this firm. The superintendent will come in the mill with orders, instead of giving them to the foreman, that he may give them out to the men and follow them up. He will often give them out himself, and sometimes will start the job himself, only to half finish it, get stuck, and turn it over to the foreman or one of the men to finish. He is what you might term a "busybody," that is quite expensive around the mill. He thinks he knows it all, and just knows enough about the business to make himself a nuisance.

He will go in the mill and give orders to change the feed on the planer from 60 to 80 lin. ft. per minute, to dress a carload of roofers, machine to be crowded to its full capacity. The result is, knives are taken off with chunks knocked out of them 1/4-in. deep or more, as this class of stock is more or less knotty, as the reader knows. The wear and tear on the machine is not taken into account at all, and I would say that the man who can build a machine to stand such abuse would do well, as he would put all competitors out of business.

Now, let the heavy planer advocate sit up and take notice: The above is a good example of lack of system. A 30-in. planer, for example, dressing 1-in. stock (some of which is 1 1/4-in. or more at one end), with the bed of machine kept full its entire width, at 100-ft. feed, will surely give way somewhere sooner or later. If you do not believe it, try it. I have seen much of it. They are machines, of course, but there is a limit.

Save the Lumber

Each year we see the timber forests rapidly being consumed, and surely we must face the day when lumber will be a great luxury. But how many of us that are interested in this consumption of the forests and are hastening that day, ever stop to think how we might help in the way of prolonging the supply by being more cautious and getting more out of the material we are handling, says A. S., in the Woodworker, Indianapolis. In this article I wish to deal with the planing mill end of manufacturing lumber, where there is quite a lot of material spoiled and wasted. There are many ways and causes for spoiled stock. For instance, take the matcher, when a sliver of wood gets caught under the stock at the side heads and raises the stock up

and throws the matching entirely out of center. If this is 4-in. ceiling, with a bead, it is not fit for anything. I have seen this frequently happen, and at times a large truck-load run before it was discovered.

No one wants stock that is run this way. It will not match and it is nearly impossible to get anything out of it, for after ripping off the bead, tongue and groove there is not much left to do anything with. The operators should and can prevent a great percent of this loss by simply going around often and looking at the stock, and not keep on feeding it through until they get the whole load done, as they have a habit of doing.

The grade of the stock is another point that is often not given proper attention. The operator should have a pretty fair idea what the stock is to be used for and how it is used, and by that he can govern the feeding of his material as to the face, and not stick the boards in any old way just to get rid of them.

There is probably no other place in a mill or factory where more money can be made or lost than at the cutting-up saw. There is the place to have a man that thoroughly understands his work, and one that will keep his employer's interest in mind at all times. He must be watchful of his cutting bills, try to get everything possible out of the material, and keep the scrap-pile down low.

At the self-feed rip saw one can save by leaving just enough for the stickers and matchers to finish on. Some leave the stock too wide. The writer was in a plant some time ago where they were ripping the stock $\frac{1}{2}$ -in. wider than the finish width; $\frac{1}{4}$ -in. is plenty for all times, in my estimation.

The double surfacer spoils many boards at different times by having the lower head cutting too heavy, and when running a thinner piece it comes out rough on the upper face. Many pieces could be dressed up that are laid aside on this account, if one would watch and have the lower head cutting just enough to clean the material up.

So, it's a piece here and another there, from one machine to the other. For some reason stock cannot be used for what it was gotten out, and eventually the most of it finds the scrap-pile, and the scrap-pile in the end gets to the kindling saw. These things have been written about time and time again, but in order to keep them constantly before us we must, like a big advertiser, keep everlastingly at it. Let us all join in a movement to watch our stock that we are machining, and try and save it in every way we possibly can, and eliminate some of this useless waste.

Band-Saws in the Woodworking Shop

Among all power saws the band-saw seems to be the one that offers the greatest advantages through its great usefulness for all sorts of purposes, says a German exchange. The band-saw is not as dangerous as other saws and can be used with profit for cutting lumber both with and against the grain. It can also cut along crooked lines if need be, which is another advantage. There are two more advantages, namely: First, the low percentage of waste, and second, the low power consumption, especially important for the small shop. For cutting tenons, for slitting boards into thinner sections, and for similar work, the band-saw is useful; in fact, it can be used in any shop in a multitude of ways.

Nevertheless the band-saw is often missing in many German shops, the reason being that in many cases the band-saw has not been given the care that is lavished on other machines and in consequence gives poor results. There are comparatively few men who know how to handle a band-saw right. Furthermore, a band-saw blade properly handled will last a good many years.

The following rules have been laid down by skilled workmen who know how to handle band-saws and have obtained the highest efficiencies from their saws:

The sawblade must be of superior quality and no money should be spared to get the best on the market.

The reserve blades must not be kept in a moist place as this will lead to rusting and weakening of the blades.

The thickness of the blade should be one one-thousandth of the pulley diameter, as in this way we get the proper proportions between pulleys and saw blades which insures proper tension and bending factors.

Band-saws with too small pulley diameters are not advisable; the bending moment is too great and the saw is strained beyond a safety point.

Band-saws should have double end journal bearings, as this insures quiet operation of pulleys and saw.

Pulleys running on ball bearings are especially advisable as the pulleys will run smoothly and will require little power and oiling.

Both pulleys must be exactly centered and balanced.

All complicated iron guides should be avoided in small band-saws with tables as they work too noisily. Wooden guides that are easily exchanged and can be slightly oiled are excellent.

When the saw is not running the blade is to be released from its operating tension as otherwise the blade, having become hot in work-

ing, cannot contract properly in cooling and is liable to break.

The angles of the tooth backs should be obtuse and not acute, and should be well rounded. The teeth should be of equal length and frequently inspected. The width of the set of the different teeth should be regular and not greater than one-half the thickness of the blade. Only when sawing very wet or moist lumber can the set be up to three-quarters the thickness at each side.

The teeth ought to be sharpened as soon as the operator notices the least dulling, because operation with dull teeth strains the blade too much.

The blades must be soldered with extreme care. There should not be the least unevenness on the sides or the back of the blade. The soldering lamp should be used, not coal fire or hot tongs, as these are not accurate enough to solder the blade properly.

The soldering joint should not be cooled suddenly as this would give the blade at this point a greater degree of hardness than anywhere else.

If the above rules are followed the band-saw will give excellent results and will repay the care spent in keeping in good condition by increased efficiency and long life of the blade.

Some Problems in Feeding

The introduction of fast feed matchers and moulders has been the means of putting many a man on his mettle as a feeder, and it is a man's job, too, to even select stock for face and keep the machine filled, if the stock is 12 feet long or shorter. But there are real problems of feeding in factory and detail work of which the lumber maker has not heard unless he has had experience outside of the regular planer.

The growing scarcity or rather the advancing price of lumber has induced the practice of buying poorer grades of factory lumber, and the poorer the lumber the higher the quality of workmanship or it must be to make it a perfect product.

The later methods of buying and cutting this poorer lumber, make it necessary for the yard men, the cutter and the sticker man, to understand the details of the work to be gotten out to such an extent that it may include certain hidden defects.

It is not sufficient that they are furnished with an outline detail of the various members, like the mouldings in the universal moulding book. They should have a sketch of the parts as they stand in relation to each other and to the balance of the work. In other words, the details furnished the workmen should not only show how the pieces are shaped, but should show the parts exposed and the parts covered.

It often happens that stock will come to the moulder containing knots, wane or sap and at the same time the feeder knows or should know, that the job calls for the finest kind of stock. If he is a good sensible workman he will first examine his billing sheet for details and if he does not get light there, he will find the detail somewhere. In a well ordered shop the detail will come to him, but before condemning the stock he will learn how it runs and how it goes together. The chances are that the cutter can give him the information he himself used in cutting the pieces.

Another place where the good sense and judgment of the feeder comes into play is in refusing to machine stock which is unfit for the purpose intended. I have known feeders who would put through all the stuff sent on to them regardless of the defects contained, with the result of spoiled material and another setting for the same work. One of the functions of a foreman or superintendent is to give such information as that in question, and the feeder who puts through a lot of unfit material should be brought up standing. At the same time he should be given the benefit of adequate instruction as to what is fit and what is not.

When feeding many of the hard woods it is necessary, or at any rate desirable, to feed with the grain. This is especially true of pieces to be rabbeted. However, it is frequently impossible to feed with the grain slanting the right way and still avoid showing some of the defects in the pieces. A great deal of this experience comes in handling hardwood sash, doors, panel-work and fixtures. The stiles and rails have to be paired, faced and edged, and if the feeder does not have to do this, it is an easy matter for him to put through the materials with the face marks already on, but he cannot reverse ends or turn them over to take advantage of the grain. And right here is where a lecture could be given on the subject of running cross grained stock, but outside of selection in feeding, it has no place in this article.

Besides having a comprehensive knowledge of the woods and the purposes for which they are used, the feeder should be perfectly familiar with the machine he is running, and especially with the springs, stops, pressure bars, speeds and speed control. He should know how to hold his stock firmly from chattering under the knives and still be able to force a steady feed. If the feed stops he should be able to locate the difficulty without driving the stuff through with a sledge. There are so many things that might cause a piece of stock

to buck, that the feeder should have a sort of routine of investigation, before doing anything rash.

One of the causes of poor feeding is pitchy or gummy stock, but an adequate supply of oil or grease will overcome this. Extra thin stock is another bother, but usually may be forced through by feeding a thin strip on top of the stock. One objection to this last is that it holds the chipbreaker away from the stock, but generally this does not matter. Ends too thick to start under the feed rolls readily is another source of bother, but we generally find out what is the matter right away. Sometimes the side head belt will run off, or the head choke down from too heavy a feed and the extra width of the board clog against the side stop. This is one of the things we are apt to overlook for some little time.

One of the most obscure reasons for balks is that caused by trouble from the under side of the stock. Sometimes the end of a piece will have a short downward curve so that it will catch on the rear bed. We can locate this trouble by seeing that the stock has stopped with the end just over the bottom head. Another and still more obscure stoppage is caused by a sliver catching the rear bed at the same place and slivering back until it stops the feed. As this may occur at any place in the length of the board, it has been the means of a good deal of worry to some feeders until they learned to look for trouble in all of the likely places.

The feeder of experience will glance at his feed rolls the first thing when his feed stops, for if the rolls are not running the trouble is located at once, but perhaps not fully, for a clog in the feed will sometimes cause the belt to slip or run off. If the mechanism is all right then the feeder looks for the troubles outlined, which with some minor causes will pretty thoroughly cover the ground.

To feed a moulder as it should be fed is no lazy man's job, and it is doubtless for this reason that in nearly all detail mills the moulder operator does his own feeding. Occasionally when he has a good run of all good lumber he will call in some apprentice help while he does some grinding, but for the general run of special work it takes as high a grade of intelligence and as careful work to do the feeding as to fit the knives and set the machines.—Berlin Quality.

Journals and Their Care—Some "do's" and "don'ts" to Consider

Caution:—Never pour hot metal on a journal. This act of carelessness is very apt to spring any journal and create trouble immediately, says Berlin Quality. A mandrel turned from any old piece of shafting, large enough, will be of more service than using the cylinder, as it is lighter to handle and can be heated before placing in boxes, thereby warming up and drying out the receptacle for metal. Level on Bed plate or platen by using sized blocks, being sure to clamp down as the hot metal will be inclined to lift the mandrel.

How many good journals have been spoiled by poor judgment in using them to cast boxes, will never be known. Once sprung they can never be the same as new. The most permanent method of bringing them back is to heat black hot and spring the bend past center and allow to cool, when journal will come nearly straight. Then turn up, using a lathe tool that will finish smooth, not a diamond point.

It is a great mistake and one that is made every day, in machine shops, to turn up a cylinder journal with a diamond point lathe tool which leaves the surface rough, then take a file with the lathe speeded up and attempt to file the work smooth. This method is all wrong as the file will undoubtedly cut into the soft spots and glide over the hard ones, leaving the journal lumpy.

Use a square ended lathe tool set in tool post to cut without any chatter, do the cutting as far above center as possible for practical work. One little thought expressed as a help here: In casting boxes of any kind, be they for planer cylinders or other work, cast cap and box at one pour. This can be done just as easily as casting box first and cap after, saves more than half the time and you have a much neater job with scarcely any surplus metal to cut away. You also save your liners and after scraping to bearing, add just one or two more thicknesses of cardboard and you are done. It is a good practice to use thin cardboard for liners instead of one solid piece, as the wear can be taken up evenly throughout the length of the journal by removing one strip from each side of cap. This, of course, treats on the old style box, of which we have yet plenty on various makes of machines.

Now we have gone to the trouble of having a Babbitting Mandrel made, have levelled same in machine, cast our boxes flush and neat, scraped to fit the journal, cut good oil valleys in boxes and caps, screwed down firmly, yet with a free turning cylinder. Is that all? Some men seemingly think so. But let me advise, just here is where "eternal vigilance is the price of liberty."

Don't fail at least once a day to see or rather test for looseness in the box. Make it a rule, "A golden rule it is," to throw off your belts at the noon hour or after the whistle at evening, test all your cylinder journals for play. I say noon or night because your journals and boxes are warm and expanded. It would be ill advice to suggest doing this while everything is cold, because when journals are warm-

ed up they would probably be so snug and start heating. If you will attend to this daily, I will guarantee you can run a cylinder five years without same going to lathe for truing up.

There is no one other neglect that will put a cylinder journal flat sided quicker than loose journals. It matters not how well balanced the head and the cutters are. One hour's run will start this evil. I have seen men who knew they had play in their boxes run same until noon or night, promising themselves then to take up.

Don't do it. Stop right now, even if the ship is waiting or the car is in demurrage. Always keep snug journals, then you will have peace in your soul and a smile on the Superintendent's face. I only wish that every planer man would be convinced of the importance of this little point.

We know that with balanced knives, bolts and heads we are going to have very little wear in our boxes, but what we want to do is catch that wear when it gets there, not after it has wrought its trouble. On all your cylinder journals where you possibly can, use sight feed oilers. Why? For a continuous lubricant, to save the oil consumption, to save the metal bill, to save the time of casting new boxes, to keep dust proof journals. "Every little bit helps" and in this case the "Little Bit" is sight feed oilers. Try it and see if I am not quoting scripture and telling the truth.

Handling Box Factory Lumber

The increased cost of lumber and consequent small margin of profit in box manufacturing, has led to many efforts to lower the factory cost and reduce the number of times it is necessary to handle stock at the box factory so as to leave room for a margin of profit. At some institutions using large quantities of box stock there is more decided effort to eliminate the double handling involved in unloading stock from the car and piling it on the yard, then reloading it on trucks again to bring it into the factory, says J. C. T., in the Wood-Worker, Indianapolis. There are two methods of taking stock directly into the factory from a car. One is by handling it through a receiving planer, and the other is by handling it through a resaw. Those using a big receiving planer have the planer located near where the cars are to be unloaded, or, rather, have a switch running right into the planer. To do this right involves the modern high-speed planers, using the self-feeding device to help out. Then the stock is run right from the car down to the planer, and practically the same work that unloads it puts it through the first process of manufacture.

If the stock were thoroughly dry it would then go right on through the factory in the regular way, either through the resaw and then to the cutting saws, or be cut and then resawed, depending on the kind of stock and method of handling. Usually, however, stock received at the box factory is not as dry as it should be and must go to the dry kiln. The old method was to pile stock on the yard to dry awhile, then rehandle it into the dry kiln for the thorough drying; then from the dry kiln it went into the box factory.

For the method of handling lumber directly into the planer as it is received, an advantage is claimed, even if it still has to go to the drykiln, for the reason that it has been uniformed in thickness; part of the thickness has been dressed away and fresh wood has been laid bare for the drying, which, it is claimed, makes the drying easier and quicker. Dressing before drying is an idea that is receiving quite a lot of attention from the wood-working fraternity these days.

It is impractical to get as good a finish by dressing lumber that is only partly dry, then running it through the kilns. In box factory work not a very high finish is called for usually, and in other work where a higher order of finish is called for, it is quite a common practice to redress it afterward, anyway, so that preliminary dressing or sizing is good enough, even if it is done on comparatively green stock. It is said to reduce the time required for drying considerably, to make the drying better, and in box factory work is said to reduce the cost.

Another method for handling box factory lumber, which is based on the same general idea, but is carried out differently, is the practice of running stock right from the car through the resaw. This method requires a resaw located at the receiving end, instead of a planer—a good type of modern resaw which will handle the lumber as fast as an ordinary crew can unload, inspect and tally it. The approved method is to have skids or an unloading deck right from the car to the feeding end of the resaw, and as the stock comes down from the car it is measured and inspected in transit, goes right on through the resaw, and from there into the drykiln, where, being only half its former thickness, it naturally dries in less time.

Of course, with either of these methods, it is necessary to unload and pile on the yards a certain percent of the stock, enough so as to keep stock ahead for emergencies for such times as the receipts are not regular, and to keep stock of different thicknesses to make the variety necessary. These are methods that are applicable especially to factories receiving lumber from mills where care is used in manufacture, and the lumber runs even in thickness, so that the 1-inch stock will be 1-inch stock, and a whole carload of it can be run through

the receiving machine without any interruption for sorting out. Then, when thicker stock for special needs is bought, it may be received and piled on the yards in the same old way.

This is a method that makes against the idea which prevails in some places of carefully sorting lumber as it is received on the yards for thickness and width, and it would therefore not be so fruitful of results where the stock is shipped in varying widths and thicknesses. If a mill ships for 1-in. stock a variety of thicknesses varying from $\frac{3}{4}$ to $1\frac{1}{4}$ -in., it is worth the extra handling involved in piling it in the yards to take the pains and sort it out, because often enough $\frac{5}{4}$ and $\frac{6}{4}$ stock can be secured to more than pay for the trouble. This is stock that costs extra when one wants to buy it from mills that make a specialty of careful manufacturing. The methods outlined here are those which apply best in receiving and handling lumber which has been carefully sorted at the mills for thickness, and the different thicknesses loaded up on different cars.

By and by, with the disposition to use scrap and trashy stock in the mills to save cost, it will be the cross-cut and the rip saw that will take the place at the receiving end, so that as this trashy stuff is unloaded it can be worked up and the bulk of the waste eliminated before it goes into the kiln or the stock sheds. Thus we will develop an entirely new method of handling raw material as it is received at the box factory.

Insurance Efficiency

By Alvin T. Coate*

Fire insurance by its vital importance demands first place in such a discussion. What is fire insurance in real essence? The accepted text-book answer is that it is indemnity against loss by fire; but you who, above almost all other trades, pay so heavily for insurance policies, know that collectively it is not indemnity because every one of you loses by fire every year the total sum of your premiums and against this loss you are not indemnified. Those of you who have suffered fire losses know that, after you calculated the cost of your new plant, the loss of business, the scattering of hard-won customers and the tedious delays incident to your re-establishment in business, you were not indemnified nor saved harmless.

Your immediate money loss was decreased by the amount of your recovery from the insurance companies, but you were not indemnified. Even the money paid you who had fires was warm from the pockets of those of you who did not; and thus the eternal process of robbing Peter to pay Paul goes on. The only real indemnity against loss by fire is not to have the fire. Fire insurance in its best estate is only the distribution of the loss over a wide number of losers, plus the administrative cost of the distributing process.

Fire insurance in essence is a transaction in integrity; it is the tempering the wind of adversity to the shorn lamb. If the lamb has by negligence or intent caused himself to be shorn, the transaction at once becomes fraudulent.

How then may you be least shorn by your own or your neighbor's fire loss? Remember you escape shearing only as there is no fire. Those of you who have been long in business have already contributed to the losses of others more than your own total insurance.

The cost of your very protection against money loss by fire insurance is, at least in theory, determined by the physical condition of your own plant. Your business is founded on highly combustible material in its most inflammable form. In most cases your buildings do not protect this inflammable material, but often add to its hazard. As a trade you do not have elaborate or expensively built plants. For these reasons it is often not practicable for you to go to the extent in protective apparatus indulged by manufacturers in other lines. Your plants operate most efficiently when they are near the supply of raw material. Your raw material grows in forests; as a rule then you are located in villages and small cities where the public protection from fire loss is imperfect and insufficient. You must, in the main, devise your own protection; how far can you profitably go in this direction. The most nearly ideal protection against fire in the individual plant is, of course, the automatic sprinkler equipment. Can you on sane business principles justify such an expense in your plant? From the money cost perspective, the answer to this question is the relation between the cost of apparatus, and its maintenance, and the saving in premium. The cost of installation is more easily determined than the cost of maintenance. The latter varies radically under differing conditions. In woodworking plants the physical deterioration of such equipment is small; the maintenance cost lies mainly in preventing freezing in tanks and wet systems and maintaining air pressure in dry systems.

In your trade you may probably rely on a deterioration ratio less than five per cent. annually on a combined deterioration and interest rates of, say 10 per cent. annually. Your premium cost after the plant is equipped varies in different states from 50c per hundred dollars of insurance to \$1.50 for veneer and panel plants in frame

structures. The cost of preventing water in elevated tanks from freezing in cold climates is probably the greatest single item of maintenance and is usually underestimated. For the small plant not under steam at all hours, an electrically driven pump is usually more economical and if the current is dependable and the water sufficient and unfailing, the same degree of efficiency may be produced.

In a general and approximate way, the cost of sprinkler equipment may be determined at from \$3.00 to \$3.50 per head, allowing one head for each 64 square feet of ceiling or roof surface. Next in considering this matter comes the question of what your business is worth to you. By this I do not mean your property or plant, but your business. How long would you be suspended by a serious fire and how long thereafter would it require to get your trade well in hand again? Figure this on the basis of last year's three hundred working days and add this per diem loss to your premium saving as the credit side of your protection account. Automatic sprinklers properly installed with plenty of water under pressure will extinguish 90 per cent. of the factory fires. And do not forget as a part of this calculation that you have no moral right to throw onto the bending shoulders of the public the insurance loss of your plant.

If you cannot justify in your plant the cost of sprinkler equipment, do not for that reason neglect the simpler and less expensive means. The primitive water pail and cask is still entitled to the hero medal. Liquid chemical extinguishers for ceiling and roof fires and a Pyrene extinguisher for your dynamo or motor room are an urgent necessity and cost little. Last and greatest of all is cleanliness and care. Even veneers are not chargeable with spontaneous combustion—they must be set on fire by somebody directly or indirectly. Dirty dry rooms, unprotected by steam jets, belching smoke stacks, stoves, bad wiring, combustible roofs—these are your accessories before the fact. Every one can see them—no one has the moral right to tolerate them.

Finally the commonly accepted, though partial and unsatisfactory, "first aid to the injured"—fire insurance. How much should you carry, what should it cost, how should it be written and in what kind of companies? It is one of the unexplainable things of our business system that a man who buys a suburban lot for \$400 will, before paying over his money, demand that the seller warrant and defend the title he gives; he will demand an abstract record of every transaction the poor little lot has ever known and finally he will hire an attorney to examine the abstract. He stops short only at examining the attorney. I am not defending even this omission, but the same man will buy insurance policies, which represent in many cases every dollar of his net worth, without even looking into the joint contracts into which he has entered or questioning the financial responsibility of the insurance companies issuing them.

Always remember that you cannot collect from your insurance policies more than you can prove. Keep better inventory records—they will save you time and money when the loss comes. Don't enter excessive and arbitrary depreciation charges in your ledgers. If you wish to reduce the asset value of your plant as a convertible or liquid item, do so by opening a reserve or sinking fund account. Do not attack the physical or replacement value; that is what depreciation means and there is often no relation between the two. Finally, be clean and careful in the plant, watch every policy religiously, know what your plant values are; carry enough insurance to preserve you from bankruptcy and trust in a kind Providence.

The "Screaming" Saw—Hot Weather and Temper

Answering an enquiry as to the cause and remedy for a screaming saw, a writer in an exchange says:—We have often cured this trouble in a very simple manner. Repair the table top so that the slot is narrowed down to the proper width. The passage of sawdust through table tops gradually wears a hole at the teeth of the saw, and this is often what causes the noise. When you want to whistle you pucker your mouth up and blow air through a round hole. When a saw wants to whistle it pulls the air through the slot in the table, which may, in a certain case, be of just the right size and shape to resemble the pucker in one's lips. Supplementing the answer to the question, "Does warm weather of summer soften and to a certain extent take the temper out of cutting tools, such as saws and knives?" Unless a saw is heated above 700 deg. F. the temper would not be affected at all, and unless a knife was heated above 420 deg. F. it would not be affected at all.

Three forestry taxation bills have recently been passed by the Pennsylvania State Legislature, which mark a real advance in the handling of this difficult matter. The bills, drawn by the Pennsylvania Forestry Association and the Pennsylvania Conservation Association, embody the results of study given to the subject during recent years. The policy includes a low annual tax on private forest lands voluntarily put under the supervision of the State, coupled with a deferred tax, on the value of timber, to be assessed and paid, when the timber is cut, on a basis of the percentage on the yield.

*Address delivered before the National Veneer & Panel Manufacturers.

The Retail Dealer and His Problems

Sidelines as Profit Makers—Material Bills

Sidelines for the Retail Yards

Under the general heading of "Side-lines," a retail lumber yard may carry such a varied line of materials that an ordinary customer would be hard put to discover, at first glance, that he is dealing with a lumber merchant. Nevertheless, the tendency has been growing rapidly of late to increase the range of articles dealt in by a retail lumberman. This is the tendency in fact, in all lines of business nowadays. It seldom happens that a man in any line of business can confine himself to it alone. Take for instance the business of selling life insurance. The life insurance agent invariably finds that if he can offer a man accident and sickness insurance at the same time, he is in a much better position to secure business. So it is in the lumber trade, especially with country retail yards. When a farmer goes to town it is safe to say he has a lot of things in mind which he may perhaps purchase if his money or his credit go far enough. The firm which can give him the largest range of supplies is the one he is likely to patronize. Why should not the retail lumberman be the logical one for the farmer to visit first of all, when he arrives in town? If he is in need of lumber for building a barn or silo, or for repairing his house, it is reasonably certain that he also needs nails and roofing material, possibly also plaster and paint, cement, crushed stone, gravel, lime, lath or shingles. The wide-awake retail lumberman will make enquiries about all these every time a farmer comes in to talk about lumber or even to pass the time of day, as farmers are sometimes known to do.

It is not a difficult matter to be in a position to supply nearly all the wants of customers in these lines. It is not necessary to carry enormous stocks costing a great deal of money. By keeping carefully posted in regard to each of these articles a retail lumberman can quote on them without carrying actual stocks. Samples and prices will go a long way if reasonably quick delivery can be made. Lumber is a building material pure and simple and the man who handles it in a retail way ought to be able to furnish all the other principal lines of building material as well. With modern ideas of business service, the man who sees the reasonableness of this point of view is the one who is going to make a success. The one who does not, will have difficulty in holding his own. From both points of view, therefore, the sideline proposition is a good one. It means increased business and increased profit. Failure to adopt it means that the other fellow will beat you out and that one of those days you will find yourself a back number.

Can You Make Out a Bill of Materials

While I have always advocated the desirability of dealers being able to make out bills of material for the ordinary class of frame construction, yet I very well know that there are many dealers of experience who object to the practice of doing it, even though they are competent. The prime object in the making out of a list of material is, first, to ascertain the amount of the different items needed, and second, that they may be figured on as a whole and the cost of it be determined. A building is composed of a greater or less number of various items, according to its size, finish and style of construction. Where a ground plan and elevation have been drawn and a bill of specifications made out, a more definite knowledge of its details may be arrived at by the contractor who thoroughly knows his business. Yet it is a well-known fact among architects and builders that no two contractors, however expert they may be in their business, can make out an itemized bill of material for the same building—using the same set of plans and specifications—and have it the same in number of items and quantity; and the larger the job, the greater is this variation. This fact is not only known to builders in general, but lumbermen know it as well. It is a matter of common experience with them and one that often gives them more or less trouble, especially the country retailer who has to bid with all kinds of incompetency in the building trades. The city dealer figures on bills that have been made out from plans drawn by a competent authority; the country dealer gives his estimate on bills made from the head of one or more individuals who know more or less about the construction of a building. Now, the general public knows but little about this feature in building. The general supposition is with most people who are going to build that when the size and general plan of a building is given a contractor, he is able to tell just what quantity of the different materials is necessary to complete it. But, I doubt if there ever was anyone yet who, after putting up his first building, did not find out he was mistaken in this respect. A man has to go through the experience

of building for himself before he thoroughly realizes how deceiving is the first bill as it was made out.

When a man wishes to build a house, for instance, the usual way is for him to consult a carpenter contractor. Perhaps he wants him to figure on doing the job and furnishing, or figure on doing the carpenter work alone. If there are several contractors in the town, the chances are they will hear of the job and will apply to him for a chance to figure on it. Another probability is that he will obtain the lumber bill from one of them for the purpose of doing some figuring around for himself. And so it will come about that the dealer gets several different bills made out from as many different heads, for this one building, and when he has figured them all at the same prices for each item in them, he finds that the total cost varies from ten to twenty per cent. The contractor who has made out the most complete bill naturally is given the highest estimate. It may be, too, that it is a copy of his bill that the owner has been peddling around and perchance has got a considerably lower bid on it. If he enlightens the contractor on this point, the dealer is put in a hole, if the contractor happens to be a friend and regular customer of his, for he will want to know why he can't buy material of him as cheap as the former can. A case of this kind makes it one of the most embarrassing things that a lumber dealer has to encounter, because on the face of it looks discriminating. The question is, how can the dealer "save his face" with the contractor? The fact is, it won't bear much explaining, and the less said the better. The usual way that I got out of it was that I thought the party had been getting figures from dealers in neighboring towns, and to prevent the bill from being sold out of town, I had cut the price and that he could have it at the same figures if he could land the job.

The fault of such a tangle of interests laid with the contractor who had no business to give a copy of his bill to the owner, as he might know that no two or more dealers would be apt to give the same figures on it. After a number of experiences of a similar nature I became wise to them and cautioned my contractors against giving away copies of the bills for jobs they were figuring on to furnish. Then whenever the owner came to me and wanted a copy of the bill I would explain that it belonged to the contractor and he would have to get his consent to letting him have it. In this way I protected the contractor and avoided much of the trouble I have described.

The older I became in the business the more inclined I was to the policy of favoring and protecting the legitimate and reliable contractor who stayed by me through the year and gave me the preference in his business. Many a time I have had the owner of a building come to me and try to find out what his contractor was paying for the bill of material I was furnishing. I always think that when anyone comes with a request of this nature that I am not morally bound to tell him the truth. I usually sent them away as wise as they came, without any feeling on their part against me. In other words, I was diplomatic, and that covers a whole lot of meaning concerning things in business matters.

Made Sure of His Ground

When I opened my yard in this place and found that my business would be principally with contractors, my first purpose was to try out by experience who among them were the most reliable and easy to get along with. It cost me something to do this, but after awhile I got them sorted out to suit me, and then I co-operated with these for their interests as well as my own, and when they found that I was reliable in this way I had no difficulty in getting them to work for me. There is one thing absolutely sure, the business life of a retail lumberman is so bound up with the contractors and workers in the building trades, and their interests are so interlocked with his interests that it is business folly to ignore or attempt to antagonize them. Whatever trouble there may be, or the discord they may cause, it is a part of his business to harmonize and educate them to see and understand that they and he are in the same boat and, therefore, it is for their mutual interests to pull together for the common purpose of making all they can legitimately out of their respective businesses. And in these days of increasing outside competition the need of this to the lumberman, was never greater or more urgent than now.

I have had a good deal to say on this subject during the past month or two, because in my perspective I can see that the retail lumberman is going to need all the help of those who naturally should be his helpful friends. His being forced as he is to go into the handling of more side lines than formerly, is making him more competitors among the other business men of the town, and consequently antagon-

izers of his interests. Therefore, about the only natural business friends he has in the place are the building trades men and the local paper, and if he don't cultivate their friendly interest and support, he is certainly blind to his own best interests.

The subject also is appropriate to the time, because from now on till winter the matter of selling bills will occupy a large share of the dealers' time and attention, and there is no other time of year when he needs more the "pulls" and the "boosts" of his local friends, and at no other time either is his tact and ability to gain and hold trade put to the utmost test.

What I have said in the foregoing concerning the selling of bills has been more in reference to the bills that were competitive, and which naturally bring the dealers into closer relations with the contractors. As I have before stated in a recent article, it should be the strongest aim of a retailer to secure all that is possible of the non-competitive business, and it depends largely on his own ability to make it of this character. To be able to make out a complete bill of material and sell it to the party without his getting figures on it anywhere else is, as every dealer knows, a good deal more profitable than to sell one that has been peddled around and finally auctioned off to him as the lowest bidder. Therefore, I would again urge upon every young dealer to go to work and fit himself to be able to meet this requirement when the occasion comes, and when he is so qualified, he can with confidence go at it and create more of this non-competitive business. As with everything else of advantage, however, there are things arising from it that are correspondingly bothersome, and to illustrate what I mean in this I will cite my own experience in relation to it.

Riding a Free Horse

When it became generally known that I could make out a bill for any kind of building that was then common to that locality, including bridges and windmill towers, as well as for every kind of material that went into a structure of any kind, a good deal of my time was taken up with this sort of gratis work. In those days pretty nearly every carpenter and the other mechanics were working on their own hook and therefore had to make out their own bills for materials, and in most cases this was more a matter of guess work than an accurate knowledge of what was needed. Time and time again have I had them come to me and request that I make out their bills for them. Not only the mechanics came for this purpose, but those who wanted to build also. Of course, after accommodating a party in this way I was not sure that I was going to sell the bill. I had to take my chances in that and they often went against me. I found, too, that men came and got me to make out a bill with the intention of buying it elsewhere. They would get my figures, of course, and then go and use them to beat down the dealer they preferred to buy it of.

A competitor once played a trick on me by sending one of his customers to get me to make out a house bill for him, and as I afterwards learned, told him also, that whatever my figures were he would go below them, as we were then "scrapping" for trade. I went the limit on a low figure. But the customer held him to his agreement and consequently bought a lot of stuff without profit to the dealer.

Another annoyance from this source was when a party would get me to make out a bill and give him an estimate on it, then go to a carpenter, who, perhaps, was not working for me and get him to figure out a list for him. And, of course, this carpenter would take it to the other yard for an estimate. Whenever this occurred, I almost invariably lost out, and mainly because I had figured more stuff in my estimate than the carpenter had in his. I never claimed to be any better than the average dealer, but there was one thing I would not do. I would not knowingly make out an incomplete bill for any advantage it would give me. It is poor business, and equally bad morals to "bunko" anyone in his confidence, and in the long run it don't pay. If you do attempt to make out a bill for a customer make it out as complete as you know how and tell him so, but, of course, don't guarantee that it will be all sufficient.

That is liable to get you into many unnecessary troubles, for there are too many who will try to make all they can out of the lumberman, and where a bill is guaranteed to hold out to complete a certain job, the carpenters working by the day are not so particular in the use of the material. Neither is the owner liable to be free from finding more ways to use it than he first intended. I never guaranteed but one bill I made out for a job, and that single experience did for me the rest of my life.

You Lose on the Variations

I have spoken before of the fact that no two men will make out just the same amount of material for the same job, even though they know the size and have the bill of specifications before them. Therefore it is worse in this respect when only a bare outline of a plan is given or a verbal statement given of what is wanted. A party may go to one dealer and tell him what he wants and then go over to the next dealer and tell him the same. That is, he thinks he has told him the same, but the fact is he has not done so. We often experience such cases as when a farmer comes in and wants to know what it will

cost him for a hayrack, a wagon box, or a small shed roof, stable, or maybe a chicken house, or for anything else of the numerous things that customers come in for that they are going to do the work on themselves. Having learned what he wants, we figure out a list of stuff for it as we think is needed. Most any dealer of experience can figure out such little things as these. You tell the customer what it will cost and in most cases will probably sell the stuff. On the other hand, the cost may not suit him, being perhaps more than he had counted on. So he thinks he will try the other yard and the other dealer figures it out from the same description. If it happens that he puts in one or two pieces or a few feet of boards less than you did the prices being equal, the total amount will perhaps be less by a dollar than your offer. If you happen to think that less stuff will be required it is probable that it will go out of your yard. Both dealers will be lucky if he don't play them one against the other, and eventually get it lower than the first bids of them both.

There are always a certain few in every community who have no particular affiliations with any one lumber yard, store, or any other trading place in the town. The only place they do single out is the bank, and no doubt they resent the necessity of having to buy their postage stamps at the one post office. This reminds me of an actual case I knew of one of this sort of fellows who drove over to the next town and asked the postmaster there if he couldn't sell him stamps cheaper than the postmaster would in his home town. On being refused he then asked if he would if he took a dollar's worth of them. Now this is no yarn understand, nor was the party a man below the average intelligence. He was a good farmer, but he was so constantly intent on contriving ways to hold on to every penny that he had lost the sense of proportion. I have sold stuff to this same individual at various times, but I frankly admit that it was mighty little profit I got out of him. This may be an extreme type of this class I have mentioned, and I think it would be hard to find a parallel case. I have no doubt but there are some men among the retail lumbermen who are as independent in their buying as is this class of buyers among the people in their communities. There is nothing wrong about it, of course, but you and I know that if we have any favors to show we don't go around and hunt up this sort of fellows. Neither does the travelling salesman go out of his way to offer a "snap" to a dealer who always tries to "Jew him down" on his best prices.

I used to think a homesteader was, in a way, warranted in making every dollar in cash he had go as far as possible, and it was excusable in them for doing it, but we generally got our prices when their purchases were charged on the books against them.

Hold Back the Itemized List

In dealing with this class of trade that gets you to make out these small bills as well as giving the cost, you have probably learned by experience that it won't do to give the customer the list which you have made out for him, although there are times when you may think it best to do it in order to protect yourself from another dealer's figuring on a list for the same job that has a less amount in it. For even though the competitor is friendly and not given to cutting prices on such small amounts, yet, if he figures on a smaller list than you have his price for the whole bill naturally will be lower than yours. So where you have a competitor that you are not afraid to trust you can give the figuring customer a copy of the bill you have made out for him. But if you have reason to believe he is tricky and will change the grades to get under your prices you had better advise the party to get a carpenter to make it out and then both dealers can figure on the same bill. When ever you give out a copy of a list you have made out don't use a pencil in writing it for a penciled figure can be rubbed out and another substituted that will change the amount of the item.

It is not uncommon for farmers to make out a list of what they want themselves and hand it to the dealer to figure what it will cost. Not infrequently these lists are so written out that it is difficult to decipher them and if the party acts as though he was going to take it over to the other yard for that dealer to say what he will furnish it for, you had better, if you can get him to take a copy of it written with pen and ink. Then there will be no chance to make an intentional mistake and then lay it to the poor writing of the farmer, as may easily be done, and thus escape the suspicion of trying to "flim-flam" both the customer and the competitor. For my part, in this small bill trade, I prefer that the customer who is going to do his own work make out his own lists.

C. H. Ketrige, in the Mississippi Valley Lumberman.

Handling of Crating Material

A department of wood-working which is receiving more and more attention is that in which lumber is manufactured into crating material. The largely increased consumption of material in this direction is the combined result of the experience of manufacturers who have found that protection of well-made wooden crates is superior to any other, and of the railroads, who have come to the conclusion that they cannot afford to accept goods which are not properly protected

from breakage in transit. In the furniture field, for instance, it used to be that most goods which left the factory went out in burlap, the protection of the excelsior enclosed in the covering being thought to be superior to anything else. This turned out to be a poor theory, for the railroads damaged a lot of furniture in shipment, and in addition the finish of the goods was often marred by the contact of the excelsior with the varnish.

Furniture manufacturers learned that whenever they wanted to ship out goods which had not been allowed much time to dry after being finished, the safest plan was to crate it, and accordingly they are using more crates all the time. Some small pieces are still shipped in burlap, but even where crates are not required by the traffic regulations, which, incidentally, are getting more stringent on this subject all the time, the manufacturers are using them anyway.

The cost of packing is just about the same for one kind as another, depending, of course, upon the available supply of material to a large extent. In some localities where crating material is plentiful, the cost of packing in this way has been reduced to a point below that of packing in burlap, and in those sections burlap is, of course, at once ruled out. The only weak point developed in the use of wooden packages is that the tendency is to use thinner lumber than should be specified, so that where heavy pieces are shipped there is danger of the nails pulling out and the crate breaking down under the load.

Another field in which the carriers are pushing the use of crates is the stove business. Even in carload shipments the carriers now insist, in some territories, that the manufacturers put their goods in crates. This is a reasonable contention, and has been found by the railroad men to be a necessary precaution, as the volume of claims for breakage in transit, where stoves were piled into cars without being separated from each other, was so great that the profit on the business handled turned out to be a minus quantity. The installation of wood-working machinery in stove plants, to be used for the manufacture of crates as well as patterns, which have always required the use of equipment of this kind, is therefore a logical expectation.

One finds that even in wood-working plants, however, where knowledge of the proper methods of handling operations of this character should be well known and applied, the manufacture of material to be used in crates is not given nearly the attention which it should have. The actual manufacturing operations, of course, are simple, and require the use of only a few machines of standard character; but the handling of the material, the location of the department and other important features are not given as much thought as the manufacturer could properly expend upon them.

In a large wood-working factory it was found that the department for manufacturing crates had evidently been installed as an after-thought. It was in a building, part of which was devoted to the machine shop, which is nearly always in an out-of-the-way and inconspicuous place, and was about 200 yards from the place where the product of the factory had to be crated. This meant the trucking of the material to the packing department and a lot of wasted labor and handling expense. The department was also some distance from the railroad switch where lumber to be used in the manufacture of crates was received, and here again a needless handling expense was required.

The superintendent of the plant admitted that the department was not correctly located, and said that in the near future it will be removed to the factory proper, where the material can be put through the machines and the crates set up right where they are to be used. Then the factory will doubtless find that they are saving a big percentage of the money they have been putting into the operation of their crate department, and will wonder why the arrangement was not instituted long before. Of course, it will doubtless be some time before the needed change is made effective.

The superintendent of a big furniture factory who took hold of his job not long ago found that the manufacture of crates had not been given much consideration, and one of the first things which he did was to bring about a reorganization of that department. The plant is divided into two sections, one being devoted to factory operations and the other to the warehouse. The power plant adjoins the former building, and the lines of shafting are, of course, only in that part of the plant. Apparently for this reason, the company had installed saws for cutting up crating material in the factory building, so as to conserve power, although it was necessary, in order to get material to the machines, to truck it a long distance from the cars, and then cut it to size before trucking it into the warehouse where the finished goods were packed for shipment.

The plan decided upon was to install the saws in the basement of the warehouse building, close to the freight elevator. It should have been stated that the switch running into the plant separates the two buildings, so that it is possible to unload lumber direct from the car into the basement, by means of a chute, thus placing the material right at the saws, with only one handling. The reason why this economy was not possible in the case of the factory operations was

that the lumber has to be yarded and kiln-dried before being brought into the factory, and as the switch had been run in with this in view, material which could be worked at once, such as the crating lumber, had to be handled practically in the same way, as far as the distance it was carried from the car was concerned.

The superintendent who made the change figured that he saved \$20 a car in handling expense alone, and as the company does a business of about \$250,000 a year, turning out many a carload of furniture, the saving in this department was sufficient to pay the salary of the superintendent. That is merely a demonstration of what a single idea, logically worked out, will do.

Northern Hemlock and Hardwood Production

The Northern Hemlock & Hardwood Manufacturers Assn. report that lumber production in May was 10 per cent. greater than in April, due to the continued cutting of the winter's supply of hardwood, and the sawing of a full run of hemlock by many firms. An active demand for lumber, however, caused an increase of 44 per cent. in shipments of hemlock and of 36 per cent. in shipments of hardwood in May compared with the preceding month and necessitated the movement of much partially dry stock.

Reports for the last twelve months, show that during this period, hemlock shipments have exceeded the cut by 27 per cent. and that hardwood shipments have gone beyond production by 6 per cent. Shipments of hemlock and hardwoods combined have exceeded production by 18 per cent. since June 1st, 1912.

Reports from 70 firms give these totals for May:

	Sawed		Shipped	
	Firms	M. Ft.	Firms	M. Ft.
HEMLOCK	51	43,358	62	47,036
Ash	33	748	18	603
Basswood	43	4,880	36	3,584
Beech	5	129	1	2
Birch	40	8,312	32	7,306
Elm	40	3,131	32	2,363
Maple	36	7,838	32	7,175
Oak	22	646	12	326
Mixed	19	11,439	12	2,569
ALL HARDWOODS		37,123		23,928
Total Hemlock & Hardwoods		80,481		70,964

Lower Prices at New York

Chase, Talbot & Company, New York, in their market letter under date of July 1st, say:—"This date marks the beginning of the last half of the year. A smaller quantity of spruce has been received at this market, than in any similar period, of which we have record. Notwithstanding this, prices have declined. Every character of lumber used in building construction has sold within the past month on a basis of declining figures. From the beginning of the year, the West Virginia spruce and hemlock manufacturers have held steadily to their highest level of prices, but within the past week, they have weakened and are offering certain sizes in dimension spruce at \$2.00 per M off the list. We learn that lumber business is active throughout the country, with the exception of a few Atlantic Coast cities, notably Boston and New York. Building construction has been materially curtailed, owing largely to the difficulty in securing building loans for speculative operations."

Miniature Sawmill on Exhibit

In the Industrial Building at the Calgary Fair, one of the most interesting exhibits is the little model sawmill of the Crown Lumber Company. The miniature mill has been exhibited before, but this year a new feature has been added in the form of a small waterfall coming down from the mountains, the water dashing over the rocks into the log pond which contains real miniature logs. These logs are carried up into the mill on an endless chain just as in the large mills. From inside the mill one hears the sawing of the logs into lumber. The lumber is carried out into the mill yard to be piled. A model railway train makes a trip every half minute, carrying away the lumber.

St. John Valley, N.B., pulp wood interests are expecting much of the railroad to be built across the northern part of the State of Maine, from Centerville, through Presque Isle and Washburn, which will connect the St. John & Quebec railway now building with the Quebec Central, National Transcontinental and International Railways.

"The Preservative Treatment of Wood" is the title of an interesting treatise published in two parts, the author being Irving W. Bailey. The treatise is reprinted from the Forestry Quarterly for March, 1913.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A New Cableway Skidder

The accompanying illustration shows a new overhead cableway skidder particularly designed for use in mountain logging, which is being operated at Sunburst in the Little Smoky Mountains of North Carolina.

The machine is a radical departure from all former types of cableway skidders and, judging from its reported capacity developed over a considerable period of time, is a very decided improvement on machines for this difficult work. It was designed and built by the Clyde Iron Works of Duluth, after long and careful experiment.

A great saving in time and cost is secured by the fact that this new machine carries its trolley line on a special power-driven drum, and is equipped with outhaul and setting lines which carry the heavy trolley line out under power. Thus the necessity for carrying this long, heavy cable up the steep mountain-side by hand or animal power is done away with. When it is time to make a new set, all that is necessary with the new machine is to cast off the trolley line from its anchorage, throw in the clutch on the trolley line drum, and wind the line up under steam power at high speed. The ease and rapidity

New Overload Cableway Skidder—Clyde Iron Works

of the operation obviates the necessity of a second trolley cable to be set while the first is being used.

All lines on the new machine lead from different points on an inclined boom, doing away with the thrashing and tangling of lines which is a constant cause of breakage and wasted time on the older machines. This boom is of steel and is secured by a trussed steel back-brace.

The new skidder is self-propelling, having sufficient tractive power to propel twice its own weight up a ten per cent grade.

It requires a crew of only six men, as against ten or twelve required with other cableway skidders of much smaller capacity.

Under average mountain conditions, the new machine developed a capacity in excess of twenty-five thousand feet of logs daily, as against less than eight thousand feet for a big tower machine working under the same conditions.

Two of these machines are in daily use at Sunburst; and, on the strength of the showing made by them, another of the same type has been ordered for the Little River Lumber Company, of Townsend, Tenn., whose logging conditions are similar to those at Sunburst.

Safe-Guards for Woodworking Machinery

The owner or user of woodworking machinery seldom hears these words without becoming interested, because of the opportunity to gain knowledge as to the duty of the employer to apply preventive appliances and of the operator to use them.

We all know that accidents do happen among users of woodworking machinery, but when the statistics compiled by leading insurance companies tell us that more than 85,000 men are either killed or seriously injured yearly in the United States and that 50 per cent. of the accidents are due to unguarded mechanical appliances, we are willing to believe that the matter of safe-guarding has become important, if not serious. But not to the workman alone is the im-

portance of protection. "Enjoy life by helping others to do likewise." Is it possible for the man who has lost a leg, arm, hand or even a finger to enjoy the associations of whole men when he is reminded at every turn of his deformity? No more is it possible for the employer, who has done nothing in the way of safe-guarding his dangerous machinery, to enjoy life with a conscience burdened with the responsibility of injury through his neglect.

A 16-page pamphlet dealing with safety devices for woodworking machinery has recently been printed by J. A. Fay & Egan Company, Cincinnati, O. This pioneer company has, for 83 years, been building this class of machinery exclusively. This experience and special effort to make their "safe-guards" provide efficient protection to the operator without hindering him in his work, render it well worth the time of anyone to make an investigation of their line.

This catalog No. 90 may be had on request, from the offices, 465-485 W. Front St., Cincinnati, Ohio.

Hamilton to Have Victor Saw Works

The Massachusetts Saw Works of Springfield, Mass., will locate a branch factory in Hamilton, Ont., which will be known as the Victor Saw Works, Limited. They will make "Victor Hack Saws." The Hamilton plant will be operated as an entirely separate industry. They have leased a two-storey building, which will be thoroughly renovated. When running at its full capacity, this factory will employ 75 hands, principally skilled mechanics. The President is Mr. J. W. McQuillan, formerly connected with the Massachusetts Saw Works in an executive capacity. The Vice-President is Mr. Harold Strout for some time past sales manager for the Massachusetts Saw Works. The Secretary-treasurer is Mr. E. B. Bradford, Jr., of the same organization.

An Efficient Preventive of Power Loss

S. F. Bowser & Company, Incorporated, Fraser Ave., Toronto, have issued an attractive booklet describing their Collapsible Oil Filter. The chief business of this filter is to assist in the elimination of production losses, a matter of the utmost importance to all power users. Seven and one-half per cent total friction loss is a very ordinary thing in connection with a steam engine plant. Two-thirds of this, according to the above booklet, is journal friction, which means that five per cent of the power is going to waste in friction which would practically be eliminated by the proper system of lubrication. The Collapsible Oil Filter as described in the company's booklet, is something which should be investigated by power users in general, as it means a reduction in the cost of power or an increase in the power produced.

Making the Best of a Bad Job

There are always two views to take in connection with a question of any importance. It is well, when you can't have your own way, to grin and bear it and try to find another point of view which will bring you some degree of contentment. This is the policy of the West Coast Lumberman on the question of removing the duty on shingles. "It is very probable the manufacturers of shingles in British Columbia will feel less exuberant should the tariff be removed from shingles by Congress, than they do at this time," says this journal. "Already there are symptoms of over-production, over-building of shingle mills, all of which means the downfall of the shingle industry in British Columbia. Generally speaking the shingle manufacturers in British Columbia have been a pretty close corporation or at least they have had some form of gentlemen's agreement, resulting in maintaining fairly good prices. No agreement will be maintained if the product exceeds the demand very greatly. The putting of shingles on the free list will not increase the demand either in the United States or in Canada. The number of mills in Washington, which is the big producing shingle state, will be reduced but little if the tariff is removed, while the number of mills in British Columbia will be increased, making the sum total of capacity in these two sections greater. It must be remembered that this is in the face of a declining market and with the shingle manufacturing capacity already exceeding the demand. It is very probable that British Columbia manufacturers will regret any legislation that would encourage excess production in their country."

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Business Chances

For Sale

Lumber mill on Three-mile Lake in Muskoka. Cost \$2,500, will sell for \$1,300. Apply to Thos. Going, 405 Charlton Ave. W., Hamilton, Ont. 11-14

For Sale

Long Lumber mill with store and new house for manager, several workmen's houses, barns, etc., with five hundred acres of freehold lands, located on Matapedia River and I. C. Ry., right in the heart of a good timber country. Will sell very cheap in order to close up an estate. Box 834, Canada Lumberman, Toronto, Ont. 14-17

Virgin Timber Limit For Sale

Ninety-one square miles of virgin growth of spruce, pine and cedar, at least three hundred million feet B.M. Property is well watered for getting out the timber, and located so as to make foreign water shipments if desired. Terms can be arranged to suit purchaser. Box 835, Canada Lumberman, Toronto, Ont. 14-17

For Sale

Three tracts of virgin timber land in one of the best states in the south. The land is the richest that is made. It is located along Red River and fully protected by levees.

One tract 2400 acres, two miles from a city of 20,000, contains eleven million feet of pine, oak, hickory, elm and ash. The timber is very fine and when cleared the land will be worth more than is asked for both land and timber now. Price \$25 per acre.

One tract 10,080 acres, twelve miles from city of 20,000, same kind of land with twenty million feet of timber on it, principally oak. Price \$20 per acre.

One tract 23,040 acres, close to two railroads, with sixty million feet of timber, principally oak and hickory, very little pine. Price \$15 per acre.

Any one of these tracts can be sold at the price, or the whole amount can be had. These properties will bear investigation and any one is worth twice what is asked for it.

Trustees' Sale of Valuable Timber Limits

The undersigned are authorized to call for tenders for the following timber limits situate in Block A, Upper Ottawa, Province of Quebec. These will be sold en bloc in two parcels.

Parcel Number 1, (Season 1913 and 1914). Limit 611 19 sq. miles River Ottawa, Grand Lake.

Limit 676, 25 sq. miles, S 1/2 16/4 Range, Block A.

Limit 677, 17 1/2 sq. miles, 14/3 Range, Block A.

Limit 678, 12 1/2 sq. miles, S 1/2 of N 1/2 16/4 Range Block A.

Limit 679, 12 sq. miles, 16/3 Range Block A.

Limit 680, 15 1/2 sq. miles, 15/3 Range Block A.

Limit 681, 25 sq. miles, S 1/2 of 17/5 Range Block A.

Limit 682, 25 sq. miles, N 1/2 of 17/5 Range Block A.

Limit 696, 25 sq. miles, N 1/2 of 17/4 Range Block A.

Limit 683, 6 1/4 sq. miles, S.E. corner of 1/2 S. No. 15/4.

Total, 185 square miles.

Parcel Number 2.

Limits 633 and 634, 50 sq. miles, Lot 8, Range 4, Block A.

The limits described in both Parcels are all surveyed and easy of access. They comprise some of the best pine and pulp-wood areas in the province.

Tenders in writing for the purchase en bloc of each parcel separately will be received by the undersigned Trustees at their office, Victoria Chambers, Ottawa, up to 12 o'clock noon of Monday, the 21st day of July next.

An accepted cheque for 10 per cent. of the price offered should accompany each tender. If tender accepted the balance of the purchase price shall be paid in equal installments at one, three and six months thereafter with interest at the rate of 5 per cent per annum.

For further particulars apply to the Royal Trust Company (Ottawa Branch), or to Code & Burrill, solicitors, Carleton Chambers, Ottawa.

Dated this 16th day of May, A.D. 1913.

The Royal Trust Company,

Trustees for Sale.

11-14

Sawmill For Sale

On Georgian Bay, near Little Current, close to north shore; practically new, well built and equipped with shingle machinery; over one mile of water front, loading dock and sheltered booming ground; plenty of timber available locally or can be rafted in from north shore or Georgian Bay. Good opening for retail store in connection. This is a splendid chance for millman with small capital; price right. Good reason for selling. Great Lakes Lumber Co., Ltd., Owen Sound, Ont. 5-T.F.

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including Friday, the 15th day of August next, for the right to cut pulpwood on a certain area tributary to the Lake of the Woods, in the District of Kenora.

Tenderers shall state the amount they are prepared to pay as bonus in addition to dues of .40c. per cord for spruce, and .20c. per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill on or near the area referred to.

Such tenders shall be required to erect a mill or mills on or near the territory, or in such place as shall be approved by the Lieutenant-Governor in Council, and to manufacture the wood into paper in the Dominion of Canada.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario for ten per cent. of the amount of their tender; to be forfeited in the event of their not entering into an agreement to carry out conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. Hearst,

Minister of Lands, Forests and Mines.

Toronto, Ontario,
May 20th, 1913.

12-15

Trustees Auction Sale of Valuable Timber Limits known as the McArthur Limits

AUCTION SALE of valuable timber limits in the Province of Quebec, held under License from the Quebec Government.

There will be offered for sale by Public Auction at the Russell House in the City of Ottawa, at twelve o'clock noon, on Wednesday the 1st day of October, A.D. 1913, the following timber limits:—

Gatineau Limit

Comprising timber berths numbers 252 to 260 inclusive, located in the district of Montcalm on the Gatineau and Ottawa Rivers, having a total area of four hundred square miles and being located about eighty miles above Maniwaki, the terminus of the Maniwaki Branch of the C. P. R.

These berths are well timbered and well watered, as will appear upon examination of the cruisers' reports below mentioned, and are believed to be among the most valuable timber properties now available.

Lake St. John Limit

Timber berths Numbers 7 and 8, Range 3, north of Lake St. John, situate on the River Alex flowing into the north arm of Lake St. John and containing about forty-five square miles.

Each limit will be offered for sale subject to a reserve bid.

Terms.—Ten per cent. of the purchase money on date of sale and the balance within fifteen days thereafter (without interest), unless otherwise arranged with the vendors.

For particulars and conditions of sale and cruisers' reports and maps of the limits, application may be made to the undersigned solicitors.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

Timber Limit For Sale

About 35 square miles, all kinds of timber with saw mill; would sell all or part. Railway through middle, two shipping places. Apply to Box 824, Canada Lumberman, Toronto, Ont. 13

For Sale

On Georgian Bay, saw mill in first class condition, with everything complete. Engine 75 h.p. Boiler 110 h.p. Sawing capacity 20,000 feet to 30,000 feet per day. Also including booms and chains. Good stable and office and everything complete. Shipping facilities by both rail and water. Size of mill site 40 rods by 5 acre water lot, with 4 acres of land. Owner retiring from business reason for selling. Address all enquiries to 201 Campbell Avenue, Toronto, Ont. 9-14

Miscellaneous

Manufactures Wanted by Town

Of Blind River. Situated on the Georgian Bay, eighty miles east of Sault Ste. Marie, Ont. Canadian Pacific Railway runs through center of town and within stone's throw of harbor. Abundance of hardwood, spruce, cedar and hemlock within close proximity.

The town is supplied with abundance of electric power from the plant of Mr. F. Deagle, situated at White Falls, near by, and if necessary a great deal more could be generated.

The town has suitable mill site which it is prepared to lease on easy terms to responsible parties, for manufacturing purposes.

For particulars apply to M. F. DYKE, Town Clerk, or F. Y. W. BRATHWAITE, Secretary Board of Trade, Blind River, Ontario, Canada. 14-15-16-17

Timber Limit For Sale

Timber Limit in Province of Alberta, tributary to Saskatchewan River; small area; conveniently situated. Estimate, recent cruise, about eighty million feet, spruce and pine. For price and full particulars, apply Box 820, Canada Lumberman, Toronto, Ont. 13-16

Gulleting a Plate Saw

I often wondered when I was young why it was that the plate saw after it was gulleted gave such trouble. Although the teeth were deeper and in most cases keener than at other times, yet they did not seem to remain sharp so long as before. The saws, I might say, would be worked in the bench until it was an absolute necessity to gullet the teeth. This meant that removal of a great deal of metal, which was taken off as quickly as possible. One tooth at a time was ground, and this meant that the tooth would change color before the grinding was concluded.

One learns by experience. I found that every saw that was ground rapidly gave great trouble. First, the metal seemed to be a great deal softer than it was before, not only that, but the saw would not stand up to the work. The rim of the saw, when running, would waver to and fro, which meant that the rim was expanded. At the time I did not know that this was the cause, neither did I know the way to remedy the evil. However, I knew after several saws had worked like this, that it was the excessive heating of the rim that caused the trouble. With the consent of my superior, I arranged

ed that the plate saws should be ground more often than they were. Instead of waiting until the teeth had almost disappeared, every opportunity was taken to put the saw in the machine and to give it a grind. This answered well. I found that instead of the rim being expanded, it would be in the same condition as it was before it was ground. Not only that, but the steel did not lose its temper and become quite soft.

With years of experience I found where I erred when grinding those plate saws. If I had taken the grinding slowly, going gently down one tooth, then on to another, so that the temperature of the metal was not raised to more than a nominal degree, all would have been well. As it was, I was grinding so hard that the metal became red and of course soft. To those who now grind plate saws, or who have to see them ground, let me advise you to avoid making any color on the teeth. When you do so, you are lessening the cutting value of the saw. If you persist, the saw will require hammering before it is in good working condition. So go gently when grinding plate saws, bring the stone down lightly on the metal, keep the emery wheel in first-rate condition so that it will cut freely. One other little thing to be remembered is, do not grind the saw without first removing all the gummy residue within the teeth. The emery

wheel will take it off, but it will gum up the emery wheel and cause it to burn. Take the gum off with a small knife and keep your emery wheel clean.

Unfortunate Disproportions

The statistics of lumber cut and shipments for May compiled by the National Lumber Manufacturers' Association showed the cause of whatever trouble there is in the lumber market, says the American Lumberman. The May cut was 10 per cent. greater than the shipments of the same month, yet to assume that the trouble was entirely in the falling off of trade would be a mistake. During the first four months of 1913 shipments were $7\frac{3}{4}$ per cent. in excess of those of the same four months of 1912. The increase in volume of shipments might be considered normal, but the cut during the first four months of 1913 was $15\frac{1}{2}$ per cent. greater than during the corresponding months of 1912. Too great production, not a light trade, is the trouble with the leading commercial woods. The moral is obvious.

Review of Current Trade Conditions

Ontario

Although there are frequent reports of dull trade in Ontario, there are just as many reports that trade is fairly satisfactory. A good deal of uneasiness developed during the last month on account of the money situation, yet large wholesalers are inclined to the opinion that this uneasiness has been overdone. Trade in the country yards is fairly active for this time of year. The chief decline in trade has been in the city yards. An encouraging feature is the recent improvement in the demand for hemlock. Wholesalers seem to be of the opinion that stocks are quite scarce and, instead of offering a price, they are, as a rule, now asking millmen how much they will take. Prices are variously quoted at from \$20 to \$22 at the mill for number one. It is believed that the improvement will help with the spruce market also. Stocks of spruce in Eastern Canada are reported light and many of the mills are pretty well sold up, so that prices which are being asked today are too high for Ontario trade. These are conditions which cannot fail to improve the general market situation in Ontario, if they continue. Apparently they can do nothing else but continue.

Trade at Ottawa is in a fairly satisfactory condition. Manufacturers report that practically all their stocks are sold, with the exception of a few small lots of mill run. Deals and mill culls were all disposed of long ago. The local trade is reported as quite active. Some improvement is also reported in the export market, enquiries from South America being more numerous. Trade with the United States continues dull on account of the tariff situation. Smaller dealers in the States are apparently satisfied with buying only sufficient to keep their customers supplied. The export trade with Great Britain is steady. Lower grades are in good demand, especially for the Montreal trade. Local prices are unchanged.

Reports from the Tonawandas tell of a falling off in the receipts of lumber at that port during the month of June. The tariff uncertainty and high prices at the mills have had much to do with this situation. Customs reports show a falling off, during June, of nearly 7,000,000 feet in receipts. Shipments from the Tonawandas by canal show a similar decline. The local market is very quiet.

Eastern Canada

Reports from Montreal are to the effect that the lumber trade in that city and in Quebec province generally is following along lines similar to that in many other parts in Canada. The financial stringency is having a marked effect upon the volume of trade and there is also indication of easier prices. Although the volume of trade is smaller than was expected, it is not so small as to warrant much apprehension. It is really in contrast with the previous abnormal active trade that present conditions seem quiet. In fact, at Montreal, it is not a difficult matter to find quite a number of retailers who report that the local demand is good. The trade with the United States, as might be expected, is very quiet, as a result of the tariff situation. Shipments of pine to the Old Country continue on a large scale, although exports of other stocks are only moderate. Steamship accommodation is plentiful. Building activity in Montreal continues extensive, the permits for June having been about \$500,000 greater than during June, 1912. The market for ground wood continues strong, with an indication that the United States demand will be quite active in the near future. A similar condition is reported in connection with pulp, for which a heavy demand is expected in the fall. News print prices are steady.

Practically all stocks at the port of St. John have now been shipped and business is very quiet on account of this and the strike. The local demand has cleaned up low grades completely. Logs in the booms at Fredericton are being towed into storage. English deals continue firm with the prospect of advance later in the season. American prices are steadily dropping. At present random is \$3 less than at the opening of the season. Stocks of lath have been cleaned up. Woodworking factories are busy and are having trouble obtaining stocks.

Eastern spruce at New York is a little easier and the demand is not expected to improve at present. Yards are fairly well supplied. Some concessions are reported on eastern spruce at Boston, for frames. Sales are reported at \$24.50. Random cannot be quoted with accuracy. The volume of business is fair and most wholesalers are expecting an improvement. Random planed spruce boards are steady at \$23.50, with matched and clipped boards offered freely at \$25.00. Shingles have been a little easier at Boston. Some of the largest manufacturers are looking for orders at \$4.15 for extras and \$3.90 for

clears. Red cedars are doubtful and \$3.90 is the highest price possible. Lath are rather quiet at \$4.15 for 1½ inch and \$4.35 for 1¾ inch.

Western Canada

Reports from Vancouver indicate that the tightening of the market in general, especially that the high price for money is having more effect now, than a short time ago. On the coast, where building operations were numerous, a temporary lull has developed. The need of money is also felt considerably on the prairies. The rate of interest is so high that municipalities are not anxious to market their bonds. Many proposed improvements are therefore being postponed, so that the lumber industry is feeling the effect in a direct manner. Many of the mills are buying their timber for present requirements only. The interior cut will not be nearly so large as was expected. The price of logs has shown a tendency to drop although there is not a large surplus. Good timber can be secured at \$11 and sometimes less than this is taken. It seems apparent however, that any temporary reduction in prices is offered only for the purpose of disposing of present stock and that there will be no surplus of logs in the market. Timber holdings continue at strong prices. One extensive owner recently asked \$5,000 for some Crown granted limits. A number of sales of Crown granted timber are reported at \$3. There is a general opinion however, that the price is steadily advancing.

Great Britain

Reports from London are to the effect that the lumber business is going ahead in a satisfactory manner. The f.o.w. goods are arriving freely and deliveries overside are extensive. Stocks are going into consumption at a good rate. Prices remain steady and the probability now is that there will be very little, if any, alterations in prices during the rest of the coming season, unless it should be in the upward direction. Forward buying continues on a fair scale and producers are apparently getting their prices. Now that the fear of decline in prices has disappeared, business is expected to progress more smoothly than it has of late. At Churchill & Sims recent auction sale a small lot of 3 x 11 first Montreal pine was quickly bought at £45 10s.

Reports from Liverpool state that business shows signs of improvement. The country trade continues good. Spruce c.i.f. values show no important change and none is expected for some time to come. Freights are not quite so firm as they were recently, but this is thought to be only a temporary change. The volume of business is not great, as shippers have only moderate sized stocks to offer. It would not be surprising if a shortage developed later on. It is certain that f.o.b. values will not decline, according to reports received from shippers. Apparently the deciding factor in any price changes will be the freight rates. Birch c.i.f. values continue firm, both for logs and planks, but the volume of business is not large. Logs are particularly strong and the business transacted is at much higher prices than the spot market would seem to warrant. Planks are a little easier on the spot, as the consumptive demand is quiet and stocks are ample. Logs are fairly firm for fresh wood, especially, Quebec, but there is still a large stock of last year's import to be cleared.

United States

No one is at all surprised about the fact that the lumber business in the United States at present is extremely quiet. The month of July invariably makes a bad showing. At present, dealers and consumers of all kinds are buying only for immediate requirements and no change in this regard is expected until well on in the month of August. The general condition of the lumber business however, is about normal and retailers are interested only in keeping up their assortments and taking occasional advantage of the very low prices which are asked. The volume of lumber moving is quite large, but the urgency is all on the part of the sellers. The building industry is fairly active although there are signs of a reduction in the total operations. The first six months of the present year unquestionably show a larger quantity of lumber distributed than did the corresponding period of 1912. Probably the increase occurred during the first three months, whereas, during May and June a considerable falling off would be shown if the figures could be had. In spite of the financial stringency and tariff uncertainty a surprising amount of trade in general is in progress. In view of the uncertainty as to an industrial revival both in America and in Europe any signs of a good harvest in the United States will have an important influence. Harvest reports up-to-date are encouraging.

Sales of several million feet of northern pine are reported of late

View of Mills in Sarnia.

Norway Silo Stock

We are headquarters for Norway Silo Stock in 2 x 6 and 2 x 8 any length up to 40 feet.

A stock of dry Norway and White Pine lumber is always on hand ready for prompt shipment.

We also cut long timbers in any length up to 60 feet from Pine or B. C. Fir.

in the Duluth district and the market appears to have a little better tone at the head of the lakes. White pine and Norway pine are holding their own in general, in spite of the substitution of other woods. In the Saginaw Valley some falling off is reported in box stuff. Northern pine at Pittsburg is steady and stocks are only moderate. The trade in the east is slow.

Southern pine manufacturers are not very well pleased with present conditions. On nearly all grades of lumber, prices are shaky and buying is on a very small scale. Apparently, dealers and consumers can get all the lumber they need when they want it. Overproduction is having a bad effect and can only be stopped under present conditions by a car shortage.

Hemlock continues in strong demand. From Ohio, Indiana, New

York and Lake Michigan markets, reports are all unanimous to the effect that piece stuff, boards, etc., are quite strong, although they are feeling the competition of low priced Southern pine to a certain extent. The demand for hemlock at New York is better than for any other wood. The same condition prevails at Buffalo. In New England, hemlock is more than holding its own. A satisfactory market is reported for hardwoods, especially when one considers that a decrease in the demand always occurs at mid-summer. A gradual improvement is expected between now and the fall. Dry lumber stocks are not too plentiful and there are frequent enquiries. Plain and quartered sawed oak in manufacturers' grades is in good demand. Good quartered sawed oak is in strong demand in the eastern markets. Ash is moving steadily and so is chestnut. Hickory continues strong and scarce. Low grade basswood is active and steady.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Ottawa Trade Showing Improvement

Ottawa, Ont., July 9th (Special to the Canada Lumberman):—Ottawa Valley manufacturers say their stock with the exception of a few lots of mill run, is practically all sold out at the present time. Deals and mill culls were all gone some time ago. Local trade is brisk.

The export trade, according to the statement of Mr. P. C. Walker, manager of the Shepard and Morse Lumber Company here, is firm and shows some improvement in enquiries from South America. On account of high steamer rates and other reasons there has lately been a falling off in this class of trade but it is expected to revive again soon. Trade with the United States is still very dull pending the settlement of tariff schedules, the smaller dealers being satisfied to buy only enough to keep their customers supplied and refusing to lay in any considerable stock. The English export business is quite good while for the lower grades there is said to be a very good inquiry from Montreal. There has been no change in local prices.

Although it is still very difficult to report with certainty, several Ottawa firms are thought to have been involved in the losses occasioned by the forest fires which swept over Northern Ontario during the past week or so. Mr. C. J. Booth, of the J. R. Booth firm stated that until the smoke cleared away their men could scarcely tell what losses they had suffered on their limits on the Canadian Northern line in the fire-swept district, but he intimated that they might be considerable. The fire also reached the fringe of the Shepard and Morse limits on the French River.

As a result of amendments made last week to the order issued by the Railway Commission governing the protection of timber along railway rights-of-way from fires caused by trains, the railway companies will hereafter be responsible for a territory extending 300 feet on either side of their tracks. Hitherto the extent of the space which they must watch to see that no blaze originated therein from sparks from their engines was not defined.

This was the only amendment of the several made that the railways objected to, Mr. Flintoff, counsel for the Canadian Northern in the West, objecting that "it would make beautiful ammunition for a jury trial." The chairman pointed out, however, that at present the railways might be held responsible for an indefinite stretch of territory. Other amendments had to do with the dumping of engine ash-pans in yards, etc.

Between 2,600 and 2,700 square miles of timber owned by the MacLaren Lumber Company on the Lievre River, will be cruised over and reported upon by Vitale & Rothesay, New York forest engineers. This is one of the largest contracts for this kind of work ever let in Canada and is an illustration of the growth of scientific methods in lumbering. Mr. Julian Rothesay, who was in Ottawa recently on his way to take up the work, stated he would have forty men engaged and expected the job to take him a year and a half. He would report on the amount of timber contained on the limits, one half of which is virgin growth, and estimate what might be cut from year to year to allow of reproduction. Mr. Rothesay stated that he had been a classmate at Yale University with Mr. H. R. MacMillan, head of the British Columbia forestry service, and Mr. G. C. Piche, director of the forestry service of Quebec.

The various aquatic clubs in Ottawa will, it is understood, again make a strenuous effort to prevent mill owners from dumping sawdust into the Ottawa River. This question, which first arose as far back as the year 1885, has been agitated periodically but with little result. The boat owners claim that it is directly against the law for the mill owners to dump sawdust and chips into the river and that

every night between five and six o'clock great blocks of it come floating down the river and have caused several upsets of canoes and skiffs.

The cancellation of cartage facilities by Canadian railway companies, which they have announced to take effect on October 1, will be brought before the Railway Commission shortly. It is believed that the refusal of the railways to perform the service any longer is due to the action of the Commission some time ago in refusing to let them increase their tariffs more than 10 cents whereas they wished to make an advance of 40 and 60 cents, claiming that otherwise they would do business at a loss.

St. John News—Shipments Cleaning up Stock

St. John, N.B., July 9th; (Special to the Canada Lumberman):—Practically no business is being done at the mills at the Port of St. John, with the exception of shipping, which will be about completed at the end of this week, as by that time nearly all the lumber around the mills will have been loaded on steamers or vessels now taking cargo in the harbour.

All the stocks of low grade lumber have been cleaned up by local demand, and the house joiners are now forced to look to outside points for their supplies. This will make it hard upon them as the rates of freight are high and will as a rule make the prices per M. higher than that paid to local mills.

The strike still continues, the men and operators having come to no definite agreement, and at the present moment it looks as if the tie-up will remain in force for some time to come.

All the logs are being towed from the booms at Fredericton into storage; and practically all the cut of logs can be cared for in this manner without any hazard to the owners.

Prices on the English deal market still remain firm, and the chances are that should business in Great Britain remain as at present, the price of deals will advance later in the season.

Ocean freights remain about the same. Tonnage is not over plenty. Cargo steamers which were chartered for St. John for deals have been cancelled because of the strike.

The prices in the American market are falling off every week and at present the price for random is \$3.00 less than at the opening in the spring. Narrow and short stock is bringing about \$20 per M. delivered, with long and wide schedules not over \$23, but it is not altogether a question of price as it is a problem to find buyers, building being practically at a stand still in New York and New England. The yards are buying only enough to supply immediate needs. It is hoped that after the hot weather is over and the tariff question settled we will have a good fall trade.

All stocks of lath have been cleaned up at this port with the exception of a few coming from outside points. Messrs. Stetson Cutler & Company have large quantities of lath and long lumber afloat from St. John at present, they having practically cleaned up all stock they had at four mills in St. John, being between four and five million feet.

All the woodworking factories report business as very good, the only trouble being to find stocks to supply their orders.

All the logs in the main St. John river will be in booms at the end of this week. No logs will have been left behind in the river to speak of, as a very clean drive has been made. The driving was done this year for the first season by the St. John River Log Driving Company and was in every way a success.

Montreal Trade Reflects Monetary Condition

Montreal, July 10th; (Special to the Canada Lumberman):—Trade conditions are by no means so satisfactory as was anticipated

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

WE CARRY THE LARGEST AND BEST ASSORTMENT
OF DRY SPRUCE IN CANADA

in the early part of the year. With expanding general business it was thought there would be a vigorous upward turn in the lumber trade, and that last year's turnover would be largely exceeded. The opening of the season gave promise of this prophesy being fulfilled, but the unrest in Europe and the monetary stringency have resulted in the market easing off. While a considerable trade is passing, there is a decided falling off as compared with the previous active state of the industry. Some retailers state that the local demand is good, others say that it has decreased. Prices are inclined to give way, a pretty sure indication that requirements are lower. Trade with the United States is stated to be very quiet, which is not surprising in view of the tariff discussion.

Large quantities of pine continue to be shipped to Great Britain, although exports of other lumber are no unusually heavy. There is plenty of steamship accommodation available.

Judging from the permits, building is as active as ever. For June the value was, according to the official figures, \$2,278,424; as against \$1,718,505 in the corresponding period last year. The total for the half year was \$9,442,288, compared with \$8,065,993. A feature of the figures is the higher average cost of buildings, when compared with 1912.

There are indications that in the near future the United States will require a large quantity of ground wood from Canadian mills. While fair sized stocks have accumulated in the United States, the warm weather has lowered the power streams greatly, with the result that little wood is being ground on the Hudson and Black rivers. It looks as if there will be a shortage of pulp in the fall as stocks now held in Canada will not be sufficient to take care of the extremely heavy demand that is almost certain to set in from the United States. Only a little over nine thousand tons were shipped into the United States from all sources during May, and it is likely that three times that quantity will be required during August, September and October.

Sulphite pulp is somewhat affected by the duty being removed from European imports into the United States, but it is probable that this will be only a temporary matter, and that prices for high grade qualities will remain steady and will go higher during the fall. Low grade pulps may be reduced in value for a time, owing to the removal of the duty from European productions. As, however, there are no stocks abroad or in Canada, it is considered that these grades will afterwards be a stronger market than before. This also applies to

kraft pulp. News print is in good demand and prices are being maintained.

The St. Maurice Valley Forest Protective Association continues to do good work in protecting the limits of the various owners in that district. The association controls an area of 160 miles long with an average width of 100 miles, and the co-operative efforts have proved successful in extinguishing this summer many small fires.

Tonawanda Trade Very Quiet

North Tonawanda, July 7; (Special to the Canada Lumberman).—Lumber receipts at the Tonawandas for June show an unexpected slump. While the tariff question and increased prices at the mills had been expected to affect the total shipments, it was confidently predicted that June would not fall much below the same month a year ago. The worst has happened, however, and there is a difference on the wrong side of the ledger of nearly 7,000,000 feet. The customs reports show that for June, 1913, only 42,855,769 feet of stock was unloaded at local docks, while the same month a year ago showed receipts of 49,640,464 feet. A little over 7,000,000 feet of this total was consigned to Tonawanda dealers, while the remainder went to North Tonawanda concerns. Up to June 1 this year, 1913 was holding close to the total of receipts during the same period for 1912, the exact total being 77,155,087 feet of lumber received at the Tonawandas. June's failure to hold up brings the total to July 1 down about 7,000,000 feet below that of last year for the same months.

The shipments of lumber by canal from the Tonawandas show practically the same falling off as receipts by water. Since the Erie canal opened on June 1, two weeks later than has always been the case, 18,990,000 feet of lumber has been sent east on the Erie canal. This represents a falling off of 7,000,000 feet from the same period last year.

Vacations and other midsummer interruptions to business generally have added their share to the dullness of the local lumber market. It is several years since the Tonawandas have been hit so hard in all lines of the lumber industry. Prices are high when it comes to buying at the mills and orders are slack for the trade. While there has been no laying off of employees, there is no inspiration either for the present or future and the whole fraternity of lumbermen is hoping Congress will soon adjourn and go home so that business of the country can adjust itself to tariff changes.

EDGINGS

Ontario

John McDonald's sawmill at Walton, Ont., was recently destroyed by fire. Fred Thomson of the Goderich Lumber Company, Southampton, Ont., is considering the purchase of new sawmill equipment.

The new plant of the Montrose Division of the Provincial Paper Mills Company at Thorold, Ont., started operations recently. The machine is 140 inches wide and the output will be about 25 tons a day, including that of the old mill. The production will be mostly bond, writing and special lines.

The John A. McLean saw mills at Wingham, Ont., were destroyed by fire recently, the loss being \$15,000. The mills were established forty years ago. The greater part of the stock of lumber was saved. Mr. McLean reports that he will re-build on a larger scale. The mills formerly belonged to Fowler & Ballantyne, from whom they were purchased by Mr. McLean in 1889.

Manley Chew's saw mill at Tannerville, Ont., near Midland, was burned to the ground recently. The mill had been running for some weeks and had a good season's work ahead of it. The fire commenced shortly after the night watchman had made one of his rounds and although he was on the scene again almost immediately, nothing could be done to stop the flames. The tramways were torn down and thus the fire was prevented from spreading to the lumber piles. The logs which were to be cut at Tannerville will now be cut by the Midland mill.

The Beaver Board Company's proposed plant at Thorold, Ontario, will be commenced at once. The company have purchased 24 acres and will build a mill costing from \$300,000 to \$400,000. Wood will be bought from different companies and unloaded on the canal as is done by the Ontario Paper Company. They have just closed a contract for 2,800 h.p. with the Niagara Falls Power people for thirty years. The mechanical equipment will require 6,000 h.p. and 500 will be used in the boilers for treating the fibre. The company also have plants at Beaver Falls, N.Y., and at Ottawa, directly on the Ottawa River. They are now planning to erect an additional mill at Edmonds, Washington, a suburb of Seattle on Puget Sound, to cater to the Eastern and Australian trade. Mr. W. F. MacGlashan, of Buffalo, is the president, and Mr. H. S. Lewis, of Beaver Falls, is secretary-treasurer.

A. F. Byers & Company, Montreal, have obtained the contract for the addition to the digester building at the Hawkesbury mill of the Riordon Pulp & Paper Company. The new structure will be 90 feet high, and the site is 60 x 30, while the blow pits will be 60 feet high; and the site 55 x 20. The foundations will be of concrete, and the buildings of reinforced concrete and brick. Provision is to be made for three additional digesters, making five new machines, in addition to which there are 6 old ones. Two of the new digesters are now installed. Two others will be put in as soon as possible, and a third some time next year, making the total capacity 45,000 tons per annum. The blow pits to be constructed by the contractors are three in number, two of which will be put in operation almost as soon as finished. The Riordon Company are modernising the entire plant at Hawkesbury by bringing the older portions into line with the newer sections, and by additions to the machinery. These improvements will cost a total of about 750,000 dollars. The company's new sulphite mill at Merriton, built to replace the one which was destroyed by fire, has just been put into operation.

Eastern Canada

The Malone Moulding & Framing Company, 48 Beaver Hall Hill, Montreal, Que., are considering the purchase of a rip saw, sticker and shaper, also a supply of ash and basswood suitable for picture frames.

The R. H. Goodday and Company's lumber mills, located at Scott's Junction, 30 miles from Quebec, on the Quebec Central Railway, were destroyed by fire on July 5th. The loss will be over \$60,000, fully covered by insurance.

The Labrador Pulp & Paper Company, St. Johns, Newfoundland, of which Mr. H. R. Reid is the vice-president has started work upon the erection of a pulp mill of 90,000 tons annual capacity, which is to be erected at Hamilton Inlet, Labrador.

The Malone Moulding & Framing Company, Beaver Hall Hill, Montreal, are erecting a new factory for manufacturing mouldings for picture frames. The building will be on a site 25 x 75, and will consist of two storeys. The foundations will be of concrete, and the factory of mill construction. The lighting will be by electricity. A hot water system will also be installed.

Recent reports from Fredericton, N.B., state that Donald Fraser & Sons are negotiating for the purchase of the Gibson Timber lands on the Nashwaak, purchased some time ago by the Edward Partington Company. When the Partington Company purchased these limits it was expected that they would commence active operations, but they have not done so. The Partington Company's cut on the Nashwaak last winter was not brought out this spring.

Wm. Copping, Joliette, P.Q., whose mill was recently destroyed by fire reports that his actual loss was about \$50,000, covered to the extent of \$30,000 by insurance. The debris has now been cleaned away and Mr. Copping expects to commence re-building at once. The new mill will be equipped with two 8-foot single cutting band mills, to take 12-inch saws; one 6-foot band re-saw; one circular gang to cut 11-inch cants; two single edgers, slashers, trimmers and all other installations necessary for an up-to-date mill. The power is to be supplied from three horizontal boilers 66 inches by 16 feet and one 250 h.p. engine. In addition to this engine another one of 150 h.p. will be installed to run the circular gang, making it independent of the other engine. The building will be two storeys, 48 feet by 160 feet, with a flume underneath as was the case with the former mill. The object of the flume is to enable Mr. Copping to install a line of shafting entirely outside of the mill to operate a planing mill which he expects to build in the course of a few months.

Western Canada

The Western Canada Shingle Company is erecting a new mill on Burrard Inlet, with three machines.

The Cottonwood Lumber Company has its plant ready at Deroche, B.C., on the main line of the C. P. R.

The McElmon Lumber Company is adding a shingle mill to its plant at Serpentine in the lower Fraser Valley.

The Northern Construction Company has completed its plant of 20,000 feet daily capacity north of Kamloops, B.C.

H. T. Ross, formerly of the Ross & Lapp Lumber Company, Lower Fraser Valley, B.C., has purchased an interest in the St. Elmo sawmill at Ruby Creek, erected last year by Brewer & Pousett.

The Arlington Shingle Company have erected a shingle mill on the E. & N. branch of the C. P. R. on Vancouver Island, close to Nanoose Bay. J. A. Christie, of Vancouver, is identified with the company.

The St. Elmo saw mill at Ruby Creek, B.C., erected last year by Brewer & Pousett, will be operated by H. T. Ross and Mr. Pousett. Mr. Ross was formerly of the Ross & Lapp Lumber Company, Mount Lehman.

The Haslam Lake Timber & Logging Company of Janesville, Wis., has secured an extra-provincial license to carry on business in British Columbia, with head office at Vancouver. The company's capital stock is \$300,000 and its attorney is Mr. James H. Lawson, Jr., Vancouver.

The McBrien Lumber Company, of Squilax, near Chase, on the main line of the C. P. R., west of Revelstoke, has sold its limits and mill to the Yale-Kootenay Lumber Company, a new concern formed by Fred Estey of Nelson and Alex. McRae, Thos. Kilpatrick and George S. McCarter of Revelstoke, Mr. Estey to be manager.

The Gordon Development Company composed of eastern Canadian lumbermen, in installing machinery to log on an extensive scale on the coast of British Columbia. Two Tacoma donkeys are part of the outfit, being the first of this type to be used by loggers in British Columbia. Alexander Barclay is in charge of the camps, the coast superintendent being Mr. A. E. Munn, of Toronto.

In the Comox district on Vancouver Island, about 75 miles north of Nanaimo, the Canadian Western Lumber Company are now employing about 700 men and operating about 50 miles of railroad in connection with their extensive logging operations. The company are also constructing a large mill in that district for manufacturing the smaller logs, since many of these are lost when subjected to the long tow to the Fraser River.

Telephone and telegraph poles to be used in the Canal Zone will be obtained from Graham Island, B.C., one of the Queen Charlotte group. Recently a pole contractor of California secured a large contract for poles to be delivered in the South, and arrangements have been made with S. D. Sewall and associates of Vancouver, whereby 5,000 poles will be taken off their limits in the north. The poles will be rafted and towed down.

A report from Big River, Sask., states that the Big River Lumber Company have commenced making arrangements for the re-building of their mill which was recently destroyed by fire. The new mill will be on the site of the old one and will be of the same dimensions. Contracts for re-building are already making progress and delivery of machinery has been guaranteed for less than ninety days. It is hoped to have the mill operating in time for at least one month's sawing before the season closes next fall.

Recent reports from Vancouver stated that a deal had been put through transferring a tract containing about 100,000,000 feet of timber on Menzie's Bay, Vancouver Island. Subsequent reports state that the tract was sold by J. H. Moore of Victoria to the Booth Logging Company also of Victoria. The price is understood to have been \$3 per thousand feet. The Booth Logging Company have installed an extensive logging equipment on the property and are taking out between two and one-half and three million feet a month.

The Medicine Hat Planing Mill Company, Limited, Medicine Hat, Alta., which was recently incorporated with a capital of \$50,000, occupies two acres of ground in the industrial section of the city and has all the necessary conveniences, such as water, gas, electricity and trackage. The machine shop is 50 ft. x 80 ft. with cement floor, the bench room is 20 ft. x 80 ft., kiln 20 ft. x 30 ft. and shed 40 ft. x 60 ft. The office building is 12 ft. x 20 ft. The mill is equipped with the very latest and most up-to-date machinery for the manufacture of sash, wood-veneer and all kinds of special planing mill work.

The Port Hardy Lumber Company, Limited, recently incorporated, have a splendid mill site, very conveniently located at Port Hardy, Vancouver Island, B.C., also known as Hardy Bay. This place is being extensively advertised at present and large sums of money have been invested in the townsites and adjoining lands by capitalists who are looking forward to a bright future for Port Hardy. The Port Hardy Lumber Company are at present busy building and installing machinery and hope in a few weeks to be in operation and in a position to supply the local demand and also to ship to other points.

The Seaboard Logging Company, Seattle, Washington, who recently obtained incorporation in British Columbia have been organized with \$250,000 capital, the full limit permitted by the charter. The company own 350,000,000 feet of timber in British Columbia, all of which is located on water front, with good harbors. They are letting contracts for between 40,000 and 50,000 feet per day and also intend to cut from 40,000 to 60,000 cords of shingle bolts. The timber is largely cedar of fine quality. The company are conducting their operations entirely by contract by responsible parties, doing none of their own logging. The officers of the company are, president, Renfrew Stevenson; vice-president, C. F. Pretty; secretary and treasurer, G. W. Scarff; auditor, T. T. Dauphinee. The head offices of the company for British Columbia are located on the 4th floor of the Dominion Trust Bldg., Vancouver, B.C.

Make Belting Do More In Your Plant—

**This FREE 40-Page Book
“The Care of Belting”**

Tells how to obtain the greatest efficiency from leather belting.

Tells how to lace belts.

How to repair the laps of leather belting.

How to make double belts endless on the pulleys.

How to cover iron pulleys with leather.

It contains mechanical rules which tell how to figure the horsepower of belting—how to find the velocity of belting—the width of belting, and the length of belting when it is inconvenient to use a tape measure.

In short, its 40 pages are a veritable fund of information—the kind every belt user should have.

A copy of “The Care of Belting” we will send you without charge. Fill in and mail the coupon—the book will be sent immediately.

As a Band Rip Saw

As a Band Resaw

Ready in a moment to either Rip or Resaw—the **FAY - EGAN** "LIGHTNING" No. 146
Combination Band Rip and Resaw is the machine you need.

If your combined ripping and resawing does not exceed 50 to 60M lineal feet per day on soft woods, or 20 to 25M feet on hard woods, you do not need to put in two separate machines.

A Fay-Egan No. 146 will take care of all this work in the most economical manner.

At the very beginning you save the price of one machine.

You save the space occupied by one machine.

You realize the highest return on your investment, as the one machine is kept busy all the time.

By simply reversing the table and raising or lowering the ripping rolls, the No. 146 is changed from a rip to a resaw or from a resaw to a rip saw—it takes but a moment to do this.

As a rip saw, it will handle material up to 24 in. wide.

As a resaw it will cut to the center of 8 in. and up to 18 in. under the guide.

The No. 146 has all of the advantages of a separate band rip or resaw. And its value is attested by hundreds of users in all parts of the world—we'll be glad to refer you to one in your vicinity—or write us for further information.

Every type of Band Rip, Scroll, Edging and Resaw is shown in our catalog—Write for it to-day.

The Wonderful Facilities of the Great Disston Works

enable us to meet the most exacting requirements in the manufacture of saws.

Here you see two gigantic Band Saws, coiled ready to be packed for shipment. While comparison with the man seated on the interior of the coil gives some conception of their size, the figures, too, are interesting.

Each band is 60 feet long, 18 inches wide, 11 gauge, 3-inch spaced teeth. The weight of each band is 434½ pounds, or a total of 869 pounds for the complete coil.

Band Saws from this size down to 1/16 of an inch in width are constructed with equal facility and proportionate despatch.

DISSTON

SAWS TOOLS FILES

QUALITY GUARANTEED

among which can be found one or more for every trade, are the finest and most efficient made. Every step of the work, from the raw material to the finished product, is performed within the Disston Plant by men of long experience, and the highest order of skill. The exceptional facilities of the immense Disston Works have greatly aided in making Disston products famous throughout the world.

KEEP YOUR EQUIPMENT GOING

YOU make money when you keep your equipment going. You'll earn most with equipment that will wear a long while and is easily and quickly repaired. This applies particularly to locomotives.

Our locomotives are designed and built for long life, hard work and quick repairs.

Extra parts are kept in stock for immediate shipment. These are made in jigs and to gauges carefully checked. Rigid adherence to standards of material are supplemented by strict

inspection and tests. Each repair part must therefore go into place with the same degree of perfection as the original part. No machine shop is necessary. This is important when the locomotive operates at a distance from a repair shop.

Consider this when you purchase a locomotive.

Dominion Express Building, MONTREAL, CANADA

DIXON'S Traction Belt Dressing

Is a perfect preservative for all leather belting, penetrating the fibres, restoring the natural oils which may wash out, protecting against water, steam and chemicals, and increasing its adhesive properties. The life of the belt and its power transmitting capacity are increased. It is also an excellent dressing for manila cables. Write for "The Proper Care of Belts," No. 238.

When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for these wet places that recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

This belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.

When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

J. L. Goodhue & Company, Limited

DANVILLE - QUEBEC

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
18in.	16 ft.	45
10	12	54
10	16	69
1	15	96
14	16	171

by using our

Patent Steel Band Mill and Carriage

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

Four Inch Steam Set Works

Will increase the capacity of your mill

Because it lightens the work of your setter, making it possible for him to put through more logs every day.

Because quicker work is possible with it than with a hand operated machine.

Because it will set up to 4 inches with each throw of the lever instead of only 2 inches which is the limit of most hand operated set works.

These are some of the reasons why several operators have increased their cut over 2,000 feet per day. You can do as well.

Send for catalogue L-6.

1628 pounds Constant Pull Without Slip—Only Cling-Surface Treatment Permits This.

The belt, 18-in. double leather, shown, runs at 3,036 feet per minute and carries 150 h.p. from a 14 ft. driver to a 42-in. wood pulley. Distance between centers 23 ft. The picture was taken when pulling full load. There was no sign of slipping. Pretty good with 3 ft. 4 1/2 in. slack, isn't it? But slackness without slip isn't the only good resulting from Cling-Surface treatment. The owner says:

"We have been using Cling-Surface for eight years with most satisfactory results on all sizes of belts and kinds of drives. When judiciously used it lessens tensions and increases efficiency as well as period of usefulness." H. H. Reid, Secretary, T. S. Simms & Co., Ltd., St. John, N.B., Canada.

If you are not treating your belts with Cling-Surface, you do them, the bearings, and yourself an injustice. Not only should the belt tension be reduced, the efficiency increased and the life prolonged, but the journal friction ought to be reduced, the driven machinery made to run more smoothly and quality of work improved. Cling-Surface accomplishes all these essentials and makes the belts perfectly dependable. It should be used on every belt without waiting for slip or other troubles.

Treat just one of your belts with Cling-Surface—note the improvement—we won't have to tell you to treat the rest. Cling-Surface is a money saver. All users know this just the same as the people mentioned above who have used it for eight years. Get our literature and give Cling-Surface a trial. Our quotations are f.o.b. Toronto.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

"Making-Good" For 30 Years

THAT is the record enjoyed by Leviathan Belting. From the inception of our business our belting has been sold on a make good guarantee.

For every kind of transmission, conveying or elevating, Leviathan Belting will be found the most lasting and efficient make.

May we send you particulars of Leviathan performance under conditions similar to those in your line of business? Write us.

two weeks' or two months'

Slump in Lumber Prices

Men of broad vision, men who have changed a vocation into the greatest industry in the land, have not permitted temporary conditions to warp their judgment.

Their timber selections have been made carefully. They sought and secured the best information regarding values that could be obtained and, acting on this information and their own initiative, their timber investments have brought them many fold returns.

Why not investigate Western Opportunities this year? The co-operation of our great organization is at your command.

HANCHETT New Hand Lap Grinders

Hanchett Hand Lap Grinder

BUILT IN ALL SIZES

The First Machine Designed Primarily as Hand Lap Grinder. All other lap grinders were designed as Automatic Lap Grinders and transformed to Hand Grinders by leaving off the automatic attachments. In this new lap grinder improvements are secured which greatly shorten the time required to grind a lap besides being more convenient and easier to operate.

We provide an adjustment for raising and lowering the emery-wheel, which is placed at the top of the machine and is controlled by a hand wheel which is under the hand of the operator while he is operating the carriage moving the emery-wheel back and forth across the saw. So that without changing his position or even moving his hand from one adjustment to another, the operator can change the adjustment so as to keep the emery-wheel in contact with the saw as the lap is ground down. In this way there is no time wasted in stopping to change adjustments, and the emery-wheel is kept in constant contact with the saw at any pressure desired. By the same adjustment the emery-wheel is quickly lowered to square the ends of the saw before grinding the lap.

This lap grinder is equipped with our improved saw table adjustment for moving the table out to square the ends of the saw before grinding the lap, or to inspect the lap in course of grinding. This adjustment is positive and will not wear loose. The table is always firmly held in position and perfectly rigid, and yet is easily released to move away from the emery-wheel by less than one-eighth turn of the hand wheel, and clamped at any point for inspecting or squaring the lap, and as easily returned. The pitch and height of the table are easily adjusted to grind a lap of any desired bevel or width.

The emery-wheel carriage runs on rollers so that the emery-wheel is moved back and forth across the saw with very little effort, and is much easier to operate than the ordinary hand lap grinders.

We also provide a hand wheel adjustment for tilting the track or ways on which the emery-wheel carriage runs, to insure that the emery-wheel shall always operate exactly parallel to the saw. This is a new adjustment which most filers who have had experience in grinding laps will appreciate. It insures equal grinding of the lap from end to end.

The improvements embodied in this construction put these machines in a class by themselves, and make the grinding of a lap by hand a very different operation from what it has always been heretofore. When a filer has familiarized himself with this machine we believe that within the time usually required to attach the saw to the older style automatic lap grinders and get the adjustments set ready to start the machine to grinding, he could have the lap practically completed on the new Hanchett Hand Lap Grinder.

Largest Builders of Wood-Working Machinery in Canada

USE THE SHIMER CUTTER HEADS

For Flooring, Ceiling, Siding, Ship Lap, Jointing, Double Ceiling, Doors, Sash, Blinds, etc.

Made of steel Forgings, they represent the greatest possible strength in compact and workmanlike manner, embodying the vital principles of clearance to all leading Bit Points. The alternate and shearing effect of the cut reduces to a minimum the tearing-out tendency of cross-grained lumber. Cutters have exact shape in their exterior circles, and uniform product is maintained indefinitely without extra trouble or expense.

The Shimer Limited, with Expansion, Fig. 628, Groove Head with 8 Bits and self-centering and spindle clamping features. Price \$36.23 each, complete.

The Shimer Limited in solid section, Fig. 625, Groove Head with 8 Bits and the self-centering and spindle clamping features. Price \$33.50 each, complete.

Fig. 203, Popular Expansion Groove Head with 4 bit seats, complete, net \$20.48. Made also with 6 and 8 Bits to each Head.

The Shimer Door and Sash Heads

Save the filing to shape at each sharpening of the cutters. They are made per order, carry in their outline the perfect counterpart of the work, thus by simply filing the Bits and setting them to the gauge the fitting of the manufactured parts is assured.

A solid Door Head with Bits to work 1 to 1 1/4 inch Doors costs only \$18.03, and an Expansion Head only \$20.63. A solid Sash Head to mould 1 to 1 1/4 inch Sash, complete with Bits, costs only \$16.91—an Expansion Head fitted out complete only \$19.51. \$62.87 will give you an excellent solid section outfit, including Door Cope Heads and Sash Cope Heads. If you want the very best with Expansion the cost will be only \$68.07.

Double the Capacity of Your Matcher or Moulder By the use of the Shimer Double Ceiling and Double Flooring Heads.

Run your stock with double tongue and groove and then re-saw. 100 per cent. gain in output for an investment of only \$40.94 and upwards.

The Bits on the Shimer Double Heads mark the saw cut line of division on the stock so that the sawyer can at once detect any variation of the saw and correct it as the board is passing through.

These Heads are not an experiment. We have made them for years and they are in daily use in the best mills of this and other countries. You will find them very complete and practical tools, carrying the Shimer guarantee to do as represented or no sale.

Heads for making Ship Lap

The Shimer Cutter Heads for Ship Lap are so proportioned in the Bits and their seats that a perfect draw cut is made. They work interchangeably with our matcher Heads and always produce good work.

Price, per set, complete, \$33.64 to \$38.48, according to thickness of cut.

Extra Bits for making Wainscoting on these Heads \$1.95 each.

Fig. 23, a Popular Solid Groove Head with 4 bit seats, complete, \$17.87. Also made with 6 or 8 Bits to each Head.

Groove Head, Fig. 2. For plain matching of tongue and groove joint, complete with Bits, \$13.00.

Jointer Head, Fig. 55, with 4 Bits in line of work. Also made with 6 and 8 Bits to each Head. With 4 Bits \$16.64.

Our Bedee Knives, recommended by users as the best thin steel knives on the market, can be furnished in any length or thickness on short notice. Write us about your requirements.

Better Lumber—

And More of it

Difference in lumber values is due to two things—quality of timber and the quality of the sawing.

If you have A-1 lumber, why cut it in a mill that will lower its market value.

You get the best that is in your timber by sawing it right, with

WATEROUS SAWMILL MACHINERY

We manufacture a complete line for the full equipment of light, medium and heavy mills—Circular or Band.

Every improvement that tends to increase accuracy and rapidity in cutting, has been incorporated in our designs.

For over 50 years Canadian Sawmill men have been cutting timber with Waterous machinery. The experience that we have acquired in this period is built into our product, and the reputation for satisfactory service which our installations have earned, is upheld in the machinery we sell to-day.

There is a Waterous equipped mill somewhere in your neighborhood. We will be glad to tell you where. Watch our machines at work and ask the operator and the owners what they think of them,—*then write us for specifications and prices.*

If you have any of our old bulletins on file, destroy them and ask us to send you our latest Sawmill bulletins. These are assembled in a handsome cloth binder and are full of interesting information that make them invaluable as a handy reference for the practical mill man.

A post card will do — send it to-day.

NO FRAYING AT THE EDGES

Dick's Balata Belting possesses perfect uniformity throughout, whereby true and steady running is ensured, fraying at the edges rendered impossible, and perfect success in fork driving guaranteed. The combination of strength and uniformity in Dick's Belts is due to the process of solutionizing to which the textile portion of the Belting is subjected, and which thoroughly solidifies and unites the whole material.

You can get all the facts in our Catalog No. 17.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 16-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

ANTISEPTIC

You cannot get good work out of your lumber horses if they are lame, blemished, sore, sick or similarly unfit. The animal with Swellings, Soft Bunches, Bog Spavins or any such blemish, whether lame or not, needs your attention.

ABSORBINE

is your own and your horse's best friend—it relieves the horse of all pain, soreness and troublesome blemish. It makes the horse better looking, better working, more fit and of greater value to you. You can work your horse at the same time. This is no new lotion but the tried and tested remedy of many years successful use.

Thousands upon thousands of horses which would have been ailing and sick and unsightly have been made fit and well—good workers and good lookers. What others have done with Absorbine you can do, too. All enquiries on special cases answered without delay—full information and instruction on request. Absorbine \$2.00 a bottle at druggists or delivered.

Manufactured only by

ABSORBINE

does not blister or remove the hair, never leaves scars or blemishes of any kind.

It is easy to apply and does not require the horse to be laid up.

Highly concentrated and only a few drops required at each application.

A Guarantee with a Vital Meaning

All claims made for **SPARTAN BELTING** are embodied in the **SPARTAN guarantee**—the broadest and most liberal guarantee made by any belting manufacturer—its your protection and guarantee of absolute satisfaction. We not only claim that **SPARTAN** will outwear any other belting material (when used under the same conditions) but we guarantee it. Don't depend upon mere "claims," when you can have the protection of the **SPARTAN guarantee**.

SPARTAN LEATHER BELTING

possesses a unique combination of extreme pliability, great tensile strength, high efficiency, and wonderful durability, thereby ensuring an instantaneous grip, less tension and a material reduction of the friction load. In saw and planing mills where the maximum of power transmission is always demanded, Spartan is absolutely without an equal.

BATHURST, NEW BRUNSWICK

When the gang draws pay for loafing

THE Millman who is studying for efficiency must see the waste in using Belts that go wrong—tying up the whole outfit. He must see the waste of precious time—which is money. He must also see the loss entailed by a gang being thrown off work, but not off the pay roll.

A cheap belt piles up a bill of expense that may seem purely incidental—but which is directly attributable to poor belting.

A belt runs slack and must be fixed—stopping an expensive machine, wasting the men's time which runs quickly into money—often falling down on deliveries and losing business.

A Goodyear Belt will not run slack—Because it will not *stretch*.

In the making of Goodyear belting, the many plies of hard-fibre cotton duck—each thoroughly permeated with rubber "friction"—are compressed into a solid combination of strength and grip.

The Goodyear "curing" or vulcanizing is done while the Belt is stretched to its utmost limit by special machinery. All tendency to stretch in service is taken away. That is why Goodyear Belts do not *stretch* in service.

The toughness of carefully-tested cotton fibre, inseparably united under tremendous pressure with high-grade rubber friction, makes a pliable Belt of great strength.

GOODYEAR BELTS

Goodyear Belts grip the pulleys. They convey **ALL** the power because they do not slip. The outer surface of rubber holds tenaciously to the pulley. The belt is pliable under any weather conditions.

This rubber covering protects the inner fabric of the Belt from rain, oil, etc., which would cause rot and decay.

Neither heat nor cold, rain or shine, can affect the pliability and effectiveness of our Rubber Belts. They remain soft under the hardest service. Repeat orders from millmen, and big increases in sales, prove that they are satisfying the demands of experienced men.

The Cost of Lumber Production

can be reduced to the minimum if care is exercised in the selection of the machinery. For years

KNIGHT'S SAW MILL MACHINERY

has been known to lumbermen as the Quality Line that makes for efficiency in lumber production — better lumber at less cost.

The style "S" mill shown herewith is built as a single mill only, and is especially recommended for cutting out small tracts of timber. Its size permits of easy transportation from tract to tract.

Full details of this mill and our entire line is given in our catalog. Write for a copy.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 33

Toronto, August 1, 1913

No. 15

Ontario's Woodworking Industry

Over 1200 wood-using industries in Ontario contributed the data for a bulletin on this industry now being issued by the Forestry Branch, Ottawa. Thirty-four different kinds of wood are being used by these industries and the detailed information regarding the various uses to which such woods are put, should be of considerable value, not only to the manufacturer by showing new means of waste disposal, but also to the house-holder by indicating what native woods are best fitted to replace the more expensive imported stock, for interior decoration, furniture and flooring.

The bulletin also shows incidentally the increasing poverty of Ontario with regard to the more valuable work-woods. Almost half of the thirty-four kinds of wood used are obtained principally from outside sources and three and one-half million dollars are annually sent out of the province for imported wood stock. The imported oak alone costs one million six hundred thousand dollars annually, for this tree has become commercially extinct in Ontario while the hickory and chestnut groves of southern Ontario have also, almost entirely disappeared. Even good clear white pine is becoming hard to obtain and its market value is steadily rising for it represents twenty-one per cent. of the total wood consumption in Ontario for industrial purposes.

Of interest to the small consumer of wood-products are the side lights the bulletin throws on the possibility of substituting cheap home grown woods for the expensive foreign species now used so extensively. Recent tests made of their physical properties have demonstrated the suitability for certain purposes of many native species, hitherto despised by the dealers. For hardwood flooring in place of the oak and maple now in general use, may be substituted the home grown birch and beech which take a high polish and have the advan-

tage of being considerably cheaper. Likewise for interior finishing, the expensive oak can be very closely imitated by stained black ash and stained birch is almost indistinguishable from mahogany, while stained red gum requires an expert to distinguish it from the costly Circassian walnut. The now expensive white pine is being replaced, where durability is not a requisite, by the cheaper spruce, basswood and elm. Poplar and balsam-fir are two of the most common trees in Ontario and that they have wider uses is evident from the fact that poplar is highly valued for hardwood flooring in Manitoba, while balsam fir is perhaps the most widely used native species in the Maritime provinces.

The bulletin also indicates the existence of a market in Ontario for sumac, apple and cherry logs. The lumber cut from them being worth \$30, \$46.50, and \$44.50 per thousand feet board measure respectively. The bulletin on The Wood-using Industries of Ontario can be had gratis from the Forestry Branch, Department of the Interior, Ottawa. A similar report dealing with the Maritime Provinces will appear shortly.

The Half Year's Trade Results

The first half of the present year has been a strange one for the lumber trade in Canada. At the beginning of the year trade was still going along at the rapid pace that had prevailed during all of 1912. The mad speed of the real estate boom, which made its effect felt all over Canada, kept on accelerating until the winter of 1912-13. When it took a forced rest during the cold weather everyone realized that the spring of 1913 would be a testing time. If the real estate activity continued, another year of high prices and strong demand were certain for the lumber trade. There were many cautious ones however, who foresaw pretty clearly the developments that have since taken place. These wise ones trimmed their sails for an approaching gale. Natural conditions assisted them as the winter was not conducive to extensive operations in the woods. Spring arrived in most parts of Canada with conditions in the lumber industry characterized by a comparatively small winter's cut and a general feeling that trade during the spring and summer would be light. It is questionable whether this would have been the case, had not the banks, with one accord decided that the time had come for cutting short the real estate boom, so as to prevent the certain catastrophe toward which events were rapidly heading. Fortunately, the banks did adopt this course and the lumber trade immediately felt the effect—unpleasant perhaps for the time being, but unquestionably beneficial in the long run.

The course of the building trade in Canada during the first six months of 1913 shows quite clearly how events have tended. Instead of showing a decided increase over the first six months of 1912, they have shown a slight decline. In thirty-two cities, for which detailed returns are shown in tabular form elsewhere in this issue, the total value of buildings for which permits were issued amounted to \$79,787,919, a goodly sum in truth, but less than the total for the corresponding period of 1912 by about \$7,500,000, a decrease of about 8 per cent. The decrease, considered alongside of the really great volume of building in progress, means very little, but its significance lies in the fact very clearly proven, that the corner has been turned. The first five months held their own in the way of increases fairly well. The drop became clearly evident in June and it is reasonable to believe that during the balance of the year the total will fall considerably short of the enormous figures for the last half of 1912. Fortunately, these facts are not cause for regret. The result may really be classed as a capital investment to ensure commercial and financial stability. The details given elsewhere are especially interesting in regard to the decreases shown. Most of the decreases are in western cities, where the real estate boom had its greatest development. Calgary, the city where the fever was greatest, now shows the greatest relapse, the decrease being 48 per cent. Other western cities are well up in the list of decreases, the following for instance: Lethbridge, 44 per cent.; Victoria, 41 per cent.; Moose Jaw, 24 per cent.; Vancouver, 12 per cent. A few eastern cities also joined in the downward march as follows: Chatham, 38 per cent.; St. Catharines, 30 per cent., and Maisonneuve, 26 per cent. On the other hand a few significant increases are shown, among them being, Port Arthur, 110 per cent.; London,

109 per cent.; Montreal, 23 per cent.; Ottawa, 25 per cent.; Fort William, 51 per cent.; Saskatoon, 59 per cent.; North Battleford, 30 per cent.; Windsor, 18 per cent.; Berlin, 23 per cent.; Kingston, 58 per cent.; Peterborough, 62 per cent.; Welland, 85 per cent.; St. Thomas, 83 per cent.; Nanaimo, 28 per cent., and Galt, 23 per cent. These increases and decreases taken together make up a total showing a decline, but indicating that wherever the future has not been discounted seriously, and where there is legitimate reason for growth, conditions are sound and promising.

That the change in real estate and building conditions has been felt in the lumber trade is everywhere admitted. In western Canada, something akin to depression has recently been reported, though there is everywhere expressed a confidence that these conditions will be righted as soon as money becomes cheaper or a good crop is assured. In Eastern and Central Canada, the chief features of trade are the slump in the demand from the United States markets—a reasonable enough development in view of the tariff situation—and the decrease in the demand for high-grade white pine. The latter feature is a curious one, but a possible explanation presents itself in the invasion of western pine, which for several years past has been usurping the white pine markets of Eastern Canada. A similar course of events has been taking place in the Old Country, where Siberian pine has gradually been taking the place of Canadian white pine, until during the present year Canadian manufacturers of square and waney white pine timber find that they can scarcely give their timber away in England. In regard to the western pine which has become so formidable a rival of Canadian pine at home, there are indications to-day of a reversal of conditions. One hears frequently now of large dealers who have been

importing western pine for the last five years, or so, changing their opinions regarding the profits secured from it. At first they were convinced that they and their customers were getting good value when buying western pine. To-day, a number of these dealers find their customers complaining that the stock is not giving satisfaction. Some of these dealers have already been compelled to give up using western pine and to turn again to the good old-fashioned Canadian white pine.

Reports from wholesalers' and manufacturers' travellers, in Eastern Canada, Ontario in particular, show that although trade is quiet, it is not dull. Some wholesalers—the exception it is true—report that during July they have had the best July trade on record, and that their profits also have made a record. This applies more to the country trade than the cities. In Toronto for instance trade has been poor, while throughout south-western Ontario active consumption of stocks has continued.

The situation as it exists to-day is unquestionably satisfactory when looked at from all angles, but there still is and probably will be for another month or two, good cause for caution and conservative business methods. An illustration of the situation is afforded by the cases of three dealers in a certain Ontario town. Two of these report splendid business. They have all the business in fact that they can handle. The third reports that business is very dull. Enquiry shows that the former two are going out after all the business they can and the third is the oldest established retailer in the town who thinks, that if there is any business going he is sure to get it. The moral is that there is a good volume of business still to be had, but that under present conditions it must be gone after vigorously.

The Value of Standardization

An interesting article upon the question of manufacturing standard as against special thicknesses of lumber is published in another part of this issue. Attention is drawn to it because the subject is one of wide importance and because, in one way and another, it comes up in almost every branch of the lumber manufacturing and wood-working industries. Everyone in the lumber manufacturing business discusses this question frequently with his customers and business friends.

Of late years there has been a noticeable tendency on the part of all kinds of manufacturers to standardize their products. In the door manufacturing business for instance, the question is of much importance. Scarcely ever does the Canada Lumberman visit a door manufacturer without being invited to express views upon the pros and cons of stock door and special doors. One manufacturer recently outlined some of his experiences. He was manufacturing stock sizes of high-grade doors and had secured a large trade, not only with architects, but with the railway companies and other similar consumers of high class doors. He had then in stock some particularly choice samples of stock doors, made for a railway company, to be used in their parlor, cafe and sleeping cars. These were made according to stock designs and needless to say the railway was getting wonderful value for its money. It was getting a door, in the manufacture of which, the workmen became experts and upon which the manufacturer was able to estimate his costs so closely that he could economize in many ways that otherwise would be impossible. This manufacturer was doing a satisfactory and profitable business and the consumer was getting exceptional value for his money.

The same manufacturer, while the Canada Lumberman was discussing the matter with him, received a telephone call from a personal friend who was building a house in a fashionable part of the city. What the manufacturer said at his end of the phone was that he would be willing to make the door that the customer at the other end was seeking, but that it would cost much more than an equally serviceable door and one just as attractive made according to a stock pattern. The customer was one of those men who had been successful in business and wanted his house to be a little out of the ordinary. He intended to secure this by having doors of his own design and many other features a little different from the ordinary line in other houses.

He felt that, if he wanted to pay the price, he was entitled to the goods. So he was, but there is another point of view. In this case the customer was a man of reason and finally saw that he would be getting more for his money both in intrinsic value and in sentimental and artistic value by taking the stock doors. He was also made to realize that the selling value of his house would not be increased by the use of doors and other features of his own design. He is now a complete convert to the idea of stock patterns in general and stock doors in particular. After all, the question comes down to the fact that a firm which devotes its attention to the production of a special line will in the end evolve patterns and finishes which represent the highest achievements in these lines.

Another manufacturer upon whom the Canada Lumberman recently called had secured an order for hardwood doors on the ground floor of a large house and pine doors upstairs, all according to a special design. The pine doors upstairs were chosen, so as to keep the cost down. The customer wanted the special doors because the architect had an idea that he could design a better door than anyone else. Fortunately for the customer, the door manufacturer and the customer called one day on the architect and laid the matter before him. The door manufacturer showed that, for practically the same price he could furnish hardwood doors all over the house if the customer would accept a stock door which gave just as good a finish to the house. The customer was ready enough to see the point and the architect learned a useful lesson.

When this question has been reduced to its lowest common factor there is really only one important side to it. The man who has lots of money and takes some peculiar delight in having his house as different as possible from other houses is entitled to get what he wants. If he will pay a high enough price there are plenty of manufacturers who will be pleased to turn out the articles he wants. The man who is looking for full value for his money in both service and appearance and who cannot afford to pay for a sentimental or aesthetic value has no business to think about special designs. He is the man who composes ninety-nine per cent. of the consuming public, and of late years he has been educated rapidly to a better understanding of this question. This fact has rendered possible the development of great manu-

facturing institutions turning out millions of doors annually. Similarly it has been the important factor in the development of great lumber manufacturing concerns. The situation as it exists to-day is a result of the old process of the concentration of effort and the division of labor, making it possible to produce results both in quantity and quality which were not formerly possible.

It is a matter of regret with some people that we are standardizing things so greatly and that we are in some danger of becoming stan-

dardized ourselves in our tastes and opinions. We may bury the regret however, when we remember that this process means a reduced cost of living and a better chance for most of us to approach our ideal standard of comfort. It is a long cry from a discussion of one-inch lumber as opposed to inch and a half and two-inch, to a consideration of the ideal standard of comfort, but the connection is close and the subject deserves more attention at conventions and business gatherings of lumbermen than it has been given in the past.

Canada's Lumber Production in 1912

The annual report of the Forestry Branch of the Department of the Interior upon the production and consumption of lumber, lath and shingles in Canada, a summary of which is published elsewhere in this issue contains a number of most interesting facts about the lumbering industry. A noticeable feature is the manner in which the report bears out the general ideas of the course of trade as expressed by lumbermen. Take for instance the matter of the trade in hemlock. During the year 1912 the trade in hemlock experienced such a marked advance in prices that the available supply was quickly reduced to a minimum. It was found that, as a result of the poor demand which had existed for hemlock before 1912, the output in the woods during the winter of 1911-12 had been considerably reduced. This is reflected in the report of the department which shows that the production of hemlock fell off by 30 per cent. and formed less than one-tenth of the total. Coincident with the decrease in the cut of hemlock, the

price is reported to have advanced by 80 cents per thousand feet. In Ontario the advance in the price of hemlock during 1912 was considerably greater than this.

Another interesting and significant feature of the report is the relative position of the various provinces in regard to their total lumber production. Practically no alteration in the relative standing of the different provinces occurred, but the positions of Ontario and British Columbia, as the two leaders, became much more interesting. Their totals are now so nearly the same that there is every reason to expect that during the present year the production of British Columbia will surpass that of Ontario. Every province in Canada showed a decrease in the total cut of lumber as compared with the cut in 1911, with the single exception of Saskatchewan. An interesting detailed report and statistical tables will be found elsewhere in this issue.

Timber Land Taxation in British Columbia

By W. I. Patterson

In these later days when the word conservation has assumed such an unwonted importance, the subject for which it stands, the more careful and economical use of our natural wealth, threatens to dissolve cabinets and depose cabinet ministers, we, who are the more closely associated with the actual carrying out of some of their far-fetched and often impractical ideas, should know from experience and observation what tends more to accomplish the object aimed at.

In British Columbia I feel certain we have a state of affairs that will prove to be the killing of the goose that lays the golden egg, and I must say she has been a most prolific layer during the last few years; yet it is deriving revenue at the wrong end of the deal, as a very large percentage of the lands held on special license cannot stand \$140 per year tax. The result will be the holder will have to take off what is marketable as quickly as possible to recover what he has invested in the property up to the present time, which will leave the balance a prey to fire, and thus a large amount of what later on would be marketable will be destroyed. We only have to visit the older provinces of Canada and states of the United States to see the ruthless destruction that took place even when the taxation was very small compared to what we have to pay in British Columbia. The desire to realize made them take out what was marketable often at an actual loss in the operation on account of over production. To-day these lands are in many cases practically a desert. No second growth of any practical value, as the cutting over of large areas in one season when a fire once gained a foothold the destruction wrought is much greater, and the distance of seed trees prevents natural reforestation. What a source of wealth this timber would be if standing at the present time, which had absolutely no value at the time the operations were carried on. Many of these areas that escaped the destruction by fire were logged over as much as four times, and more money was made during the last operation than on any of the previous ones. In the early stages of the lumber industry in the East operations were carried on if not at an actual loss with only a small margin of profit, and consequently a very small royalty to the government. This will always be the tendency in a new country. The timber is the most accessible natural resource of any new and timbered country, and can be taken out and marketed in the initial stages of the development of the country with a primitive equipment, the operator selecting the best of the material and the most accessible areas, and is satisfied with small profits as it is generally an adjunct to some other business. The tendency is always for the production to follow up and almost invariably to exceed the demand until the awakening suddenly comes, and it is true that the supposedly inexhaustible supply is rapidly nearing the end. The pity of it all is that the margin of profit is so small and so much of

the timber on the area cut over is wasted on which the government gets no royalty and the operator gets no returns. This has taken place to an alarming extent in sections where the ground rent was merely nominal, and where generally speaking the lands were better timbered on an average than we have in this country, so what can we expect in British Columbia when the ground rent is 22 cents per acre, and the regulations regarding staking were such that a large percentage of the land staked must necessarily be useless as timber land. The only thing that can possibly happen is a frantic attempt to realize what has been put in on the poorer claims as soon as possible and abandon them. This will always tend to keep the manufacture of lumber in a chronic state of over production with consequently small profits and small royalties to the government.

Permanency and Stability Required

In a country with physical features such as British Columbia where the logged over lands are so often worthless as farming or agricultural lands, the aim should be to conserve as much as possible the existing crop, which cannot be done with an excessive ground rent. On the other hand unless large lumber manufacturing concerns are allowed to have arrangements made for a sufficient amount of timber for a number of years in advance, they will not make the investment in manufacturing plants necessary to economically manufacture the raw material into the variety of forms which is necessary to make the most of it; still the matter cannot be solved by the Government holding the land unless they also operate the mills; an illustration of this is plainly seen in Germany, where the lumber mills are of the most primitive nature, and most expensive in operation. No manufacturer will put in a large plant investment when the supply of raw material is so uncertain, and is doled out by the Government as they see fit a few months in advance of the actual requirement of the operator, and in a very uncertain manner and at a very uncertain price. In a new country this system cannot be carried out. Another very important feature from the Government standpoint in the early stages of the development of a country, the disposing of timber lands in fee simple or by lease or license, is one of the most available means of securing a revenue. Thus it is one of the most available sources of immediate revenue, both for the Government and for the operator, and it would seem that all that can be obtained is to reduce the inevitable waste and destruction to the lowest possible minimum. There is no question but that by the rental of 22 cents per acre, as we have it in British Columbia, regardless of the nature of the concession held by the individual paying this tax (being as much on an acre containing 10,000 feet as on an acre containing 100,000 feet), can only produce one result, and that is, get what you have in it out of the poorer holdings at the

earliest possible moment and abandon them. It would seem only reasonable that there should be a readjustment at no very late date, and that timber lands should be taxed in a rational manner, which would be in proportion to the value. Twenty-two cents per acre as a ground rent fee is excessive, and I feel confident that the Government of British Columbia will realize this at no very late date, but as in all new countries it is just possible that they may not awaken to the fact until it is too late to save a vast amount of material which in a few years will be a source of wealth both to the Government and to the operator.

This I feel is a matter of the utmost importance in the Province of British Columbia. There is no reason why the Government of this province might not be receiving a reasonable revenue to assist in the development at a time when revenue was very difficult to secure and where every dollar judiciously spent produces such great results. Should the timber holders in the province decide, as they must do, to abandon a very large percentage of the timber lands which are now being held under special license on account of the value not being there to justify the expending of 22 cents per acre per year ground rent, the Government will lose the revenue from these lands for years to come, and, although they will have the land, still a moderate revenue from them to help in the development at the present time might be of incalculable benefit to the province before the time arrives when these abandoned lands will again be in demand.

During the wholesale staking of timber lands in the years 1906 and 1907, very much that is practically worthless was staked, from which the Government has been receiving a revenue while the parties have been holding them as a speculation in the hope of making a sale at a small profit. Many have already done so, and the day has arrived when the matter of the \$140 per year is getting of such serious importance that the prosaic cruiser and surveyor must be sent out and report conditions as they really are, and the revelation in store will certainly surprise all parties concerned, looked at from the Government standpoint. Naturally the timber owner will select the best, and those licenses he will discard will be on the outskirts of the valleys. Once the valleys are logged off, the discarded lands which the Government owns on the mountain slopes being left by the operator will almost invariably be destroyed by fire, or if they escape the fire the cost of operation will be prohibitive once the improvements in the first operations are abandoned.

Public Sentiment With Regard to the Conservation Question

To any one who is familiar with the situation it is quite evident that there is a growing tendency on the part of the public generally, who are not directly interested in timber lands, to clamor for what may prove to be an undue equity in the profits accruing from the development and operation of timber lands. This disposition is quite evident all over the American continent, and while there is no getting away from the fact that up to the present time there may have been abuses and the operators have in some cases received an undue profit from the natural resources of this continent, still even in the most glaring instances these individuals are companies who have taken the initiative and have by their shrewdness and business ability developed markets, introduced economies in the manufacturing and production of the material which enabled them, while many of their competitors failed in the same line of business and under equally favorable circumstances, to in many cases acquire a very large fortune, thinking to profit by previous experience, there is no doubt sentiment is growing to handle these natural resources as public utilities, thinking that thereby the operators' profit would accrue to the benefit of the public at large, but this does not always necessarily follow, and particularly in a new country where competition is keen. As an illustration of this, as referred to before, we have only to go to Germany and witness the extravagant and obsolete methods used there in their sawmills, which so far as I can see, is entirely owing to the fact that they have no assured supply of timber in advance to warrant them putting in sufficiently large and economical plants to operate cheaply, and I was convinced of this fact while in that country, that well equipped and managed sawmill with timber limits to warrant them laying plans for many years operations in advance would certainly be able to pay the Government a very fine royalty, probably more than they are getting out of it at the present time, and still the operator would make a magnificent fortune, and I think there is no other one thing where the legislators of the Dominion of Canada, and particularly of British Columbia, will require to exercise more caution and good judgment than in the regulations, restrictions, and taxations of its timber land.

There is no operator but what must admit that the Government must participate in the increasing value of stumpage; but personally I believe there is nothing that would tend more to make the lumber business more profitable to all parties concerned, the Government included, than a reasonable taxation based on the actual value of the holdings; reasonable restrictions on the operation and cutting of timber land; insisting upon the least possible waste, always bearing in

mind the conditions of the market, and deriving its revenue from increased royalties on the increasing value of the stumpage, and the Government and operator working together in devising the best possible ways and means of conserving the areas of virgin timber, utilizing as much as possible precautions to prevent undue waste or destruction of this, our most valuable provincial asset. I do not believe it possible for a Government to anticipate conditions for many years ahead in British Columbia, to fix either rentals or royalties at the present time for any long period of years would not be advisable. I feel confident the special license tax of 22c per acre is not wise from the Government point of view at the present time except the tax should be regulated in proportion to the value of the area held; and I am also convinced that the wise method for the Government to employ in securing revenue from its timber areas should be more by increasing royalty on the material cut, and also having different royalties on the different qualities of the material cut; for instance, there should be a royalty for the different kinds of timber, one for hemlock and larch, another for fir, and yet another for cedar. This might entail a little extra work on the part of the Department, but they would be amply repaid as it is certainly not reasonable to imagine that a person will log hemlock, for instance, with the same stumpage tax as the fir on the same area when the price he receives for his manufactured product allows him so much larger a margin of profit on the one material than the other; also I think the royalties should be in proportion to the grades of the different materials. This would have the effect of inducing the operator to log off the poorer grades of material, as the less amount of royalty would afford him a larger amount of profit on these lower grades.

A Wise Method of Taxation

As an illustration of the advisability of this method, take the cedar. The higher grades of cedar are our most valuable timber, and the lower grades are the most worthless. The towage is the same, the cost of logging is greater, cost of milling as great if not greater, as far as the process is carried through, yet the material from the higher grades will bring in the rough from \$24 to \$40; from the lower, \$12 to \$18. Thus it is evident that the system of blanket royalties as is in force at the present time is not a wise one, and tends to wasteful methods in carrying on logging operations. The same holds good as to the different kinds of lumber on an acre. So long as the supply of the raw material is plentiful, the consumer will insist on having the best. Thus we find a sentiment or prejudice created in favor of certain woods for certain purposes. We have the house builders insisting on perfectly clear fir flooring, which when once in place is covered with carpet and never seen except at house cleaning time. The operator cannot afford to log off the grades and kinds not salable. I do not think the operators in the lumber business endeavor to educate the consumers sufficiently on the question of using lower grades of material. When we look at all the facts as they are, they assuredly do not tend to conservation. The consumer of British Columbia lumber is unnecessarily severe in his demands, demanding the best and rejecting material for defects that really are not material. The lower grades of timber are not more costly to operate on from the stump to the car or pile, as our logging camps and sawmills are equipped to handle more profitably the larger and better grades of material. The ground rent is just the same on a hemlock claim and the claim that runs largely to low grade timber (and necessarily the stumpage is not as large on these claims) as on the claims of high class timber and large stumpage, and after the material is cut and moved the Government insists on the same royalty on the lower grades and cheaper kinds as on the best. There is no use advocating conservation as long as this condition of affairs exists. The Government should assist in this important matter by a more equitable arrangement of taxation and royalties. Offer every inducement to timber-holders to cut as sparingly as possible.

I think it would be a wise regulation to have all logs graded by the Government scalers, and for the present reduce the royalty or stumpage tax on what are called rough logs, also on hemlock and larch to practically nothing, even if this necessitated increasing the royalty on the higher grades; there is no doubt the waste is disgraceful at the present time, still we are the victims of circumstances; and even if regretting the waste, still the question of profit must always dictate to what extent with what material we shall carry on our operations.

World's Largest Refuse Burner

The Canadian Western Lumber Company, of Fraser Mills, B.C., probably has the largest refuse burner in the world. This great burner is 161 feet high. The feature of the burner is the fact that for a distance of 80 feet, it is surrounded by a water jacket two feet thick. Water is pumped into this jacket at the rate of 1000 gallons per minute by means of a big centrifugal pump. The walls of the burner extend above the water jacket protected portion for a distance of 50 feet and this is capped by a thirty-foot spark arrester. The burner is fifty feet in diameter and is of steel construction.

Canadian Lumber Production in 1912

Decrease in Cut Amounted to 10.17 per cent of the 1911 Total—British Columbia
Almost Overtakes Ontario—Average Mill Price 41 Cents Higher

The annual report upon production and consumption of lumber, square timber, lath and shingles, prepared by the Forest Branch of the Department of the Interior, is nearly complete and will shortly be published. The statistics in the report have been compiled from reports received from 2,558 firms operating sawmills in 1912. This is a decrease of 313 mills from the number reporting in 1911. In the majority of cases the mills which did not report were small mills cutting less than 1,000,000 feet board measure, per annum. In the majority of cases the mills which did report in 1912 reported decreases in their output from 1911. These facts indicate that the decrease in production shown by the figures below actually took place and is not a result of incomplete returns.

The total value of lumber, square timber, lath and shingles produced in Canada in 1912 was \$76,540,879, the items being: lumber, 4,389,723,000 feet board measure, valued at \$69,475,784; square timber, 65,906 tons exported, valued at \$1,825,154; shingles, 1,578,343,000, valued at \$3,175,319, and lath 899,016,000, valued at \$2,064,622.

Lumber Production

Table A gives the quantity, value and average value of the lumber sawn in Canada and in each of the provinces in 1911 and 1912,

together with the percent distribution among the provinces and the number of firms reporting in each case.

Canada cut in 1912 a total of 4,389,723,000 feet, board measure of lumber valued at \$69,475,784. This production is a decrease of 10.7 per cent. from that of 1911.

The relative places of the different provinces on the list remained unchanged with a single exception. Alberta replaced Manitoba at seventh place on the list. British Columbia is steadily increasing in importance as a lumber producing province, cutting in 1912, 29.9 per cent. of the total as compared to 27.3 per cent. in 1911. Ontario is decreasing in this respect and contributed only 31.6 per cent. in 1912 as compared with 34.9 per cent. in 1911. Quebec cut 15.4 per cent. of the total for 1912 and the same proportion in 1911. The relative importance of the other provinces was little altered by the figures for 1912.

The decrease in the total was produced by decreases in every province but Saskatchewan. Ontario cut 19.3 per cent. less lumber in 1912 than in 1911, reducing her production by over 500,000,000 feet. British Columbia reduced her cut by only 2.1 per cent., coming within almost seventy million feet of Ontario's production. Quebec cut 10.5 per cent. less lumber in 1912, reducing her production of 1911 by

† Less than one tenth of one per cent.
* Decrease.

almost eighty million feet. This was the only province that reported a decrease from 1910 to 1911. New Brunswick's production was a reduction of 3.8 per cent. and Nova Scotia cut 19.4 per cent. less than in 1911. Saskatchewan alone increased her production, cutting 16.7 per cent. more lumber in 1912 than in the previous year. The reduction in Alberta was 7.1 per cent. and in Prince Edward Island 12.2 per cent. Manitoba with 26.4 per cent. shows the greatest percentage reduction of any of the provinces.

Mill Price of Lumber Increased

The average mill price of lumber in Canada in 1912 was \$15.83 per thousand feet, board measure. This is an increase of forty-one cents from the average for 1911. The price in Ontario increased by \$1.52 to \$19.33 per thousand feet. In British Columbia the price decreased by \$0.83 to \$13.50 per thousand feet. Other increases in price are to be noted in Quebec (\$1.61), Nova Scotia (\$0.80), Alberta (\$0.03) and Prince Edward Island (\$0.52). Other decreases are seen in New Brunswick (\$0.05), Saskatchewan (\$0.70) and Manitoba (\$0.53).

Table B gives the relative production of lumber by kinds of wood in 1911 and 1912, together with the percent of increase or decrease, the total value, the average value and the percentage formed of the total; of each kind of lumber produced in Canada in the two years.

A total of twenty-eight kinds of wood were reported as having been sawn into lumber in 1912. The changes were in the dropping of sassafras from the list of 1911 and the addition of black gum, willow and ironwood. Every year a few new kinds of wood are added to the list and a few others removed. These are rare or unimportant species of trees that are cut locally for certain special purposes and do not affect the general lumber production.

Spruce, white pine, Douglas fir, hemlock, cedar, red pine and birch retained their relative positions at the head of the list as in 1910. Spruce formed almost a third of the lumber produced although the cut of this material was 11.9 per cent. less than in 1911. White pine made up over a fifth of the total with a reduction of 12.2 per cent. in the cut. Douglas fir formed over a fifth of the total with an increased production of 5.2 per cent. Hemlock formed less than a tenth of the total and its production was 30 per cent. less than in 1911. Other decreases in production are to be noted in the case of cedar (27.3 percent), red pine (5.6 percent), balsam fir (1.1 percent), tamarack (22.5 percent), yellow pine (32.9 percent), elm, jackpine, ash, poplar, oak, hickory, cherry, walnut and sycamore. Other increases took place in the production of lumber: birch (1.5 percent), maple (34.0 percent), basswood (12.1 percent), beech, chestnut, butternut and tulip.

Spruce and white pine together formed over half the lumber produced in Canada in 1912. The price of spruce increased by 81 cents and that of white pine by 97 cents. Douglas fir which formed 20.3 percent of the total was reduced in price by \$1.61 per thousand feet. Other notable increases were in the value of hemlock (\$0.80), cedar (\$3.12), red pine (\$0.48), balsam fir (\$1.46), tamarack (\$1.20), yellow pine (\$1.08), elm (\$1.18); jack pine, beech, ash, oak, hickory, butternut, walnut and sycamore. Other decreases occurred in the price of birch (\$0.68), maple (\$0.42), basswood (\$1.88), poplar, chestnut, cherry and tulip.

A brief preliminary reconnaissance of a portion of Western Ontario was made last summer for the Commission of Conservation by Mr. J. H. White of the Faculty of Forestry at Toronto. This examination shows that a very large percentage of Ontario west of Sudbury and south of the Height-of-Land is absolutely non-agricultural and is valuable only for the production of timber. Fires have done enormous damage, especially during the period of railway construction. However, a great deal of valuable young growth has come in and requires protection in order that it may reach maturity. Some merchantable timber remains in the area back from the railways which has not yet been included in forest reserves or in timber limits. Ultimately the whole territory south of the "Clay Belt," lying between the Temagami and Nipigon reserves, should be included in permanent forest reserves and protected and administered under forestry principles according to the report presented. This section will unquestionably prove a source of large revenue to the province in the future.

The Canadian Government has received definite and official assurance from Washington that in the tariff legislation now pending before Congress there will be no discrimination against Canada in regard to pulp duties. The Government has held the opinion all along that this would be the case and had received unofficial assurances to the same effect. In order to determine the question finally, however, the matter was referred to the United States officials whose duty it would be to interpret the new enactment and their statement is that no discrimination would result.

Allowing for Center Rot in Logs

In scaling logs there are a great many different ways of allowing for uniform center or circular rot. For example:

1. Subtract from the actual diameter the diameter of the rotten core and assume the remainder to be the true diameter for scaling.

2. Subtract from the full scale of the log the scale for the rotten core and assume the remainder to be the true scale.

3. Add 3 inches to the diameter of the defect, square the sum and deduct the result from the full scale of the log.

4. "For uniform defect or 3 inches or less in diameter deduct 10 feet b. m. in logs up to 16 feet in length. For defect 4 to 6 inches in diameter add 3 inches to actual diameter of rot, and deduct from full scale of the log an amount equal to the contents of a log of resultant diameter. For defect 7 to 12 inches in diameter add 4 inches to diameter of rot and deduct an amount equal to the contents of a log of the resultant diameter from full scale of log." (Forest Service's method.)

5. Another method is to note the length of log and the longest diameter of the defect, and determine the loss from a cull table. The defect is measured at the large end if it runs through the log or appears only at the large end; otherwise, at the small end. A table of this kind was prepared by H. D. Tiemann for all center defects in logs such as holes, cup-shake, and rot, which are 4 inches or more from the bark, and is as follows:

Cull Table

Loss in board feet from holes near the center of logs.

Diam. of hole, Inches	Length of log in feet							
	10	12	14	16	18	20	22	24
2	5	6	7	8	9	19	11	12
3	9	11	13	15	17	18	20	21
4	14	17	20	23	26	28	31	33
5	20	24	28	32	36	40	44	48
6	28	33	39	44	50	55	60	65
7	36	43	50	57	65	72	78	85
8	45	54	63	72	81	90	99	108
9	56	67	78	89	100	112	122	133
10	67	81	93	107	120	133	148	161
11	80	96	112	128	144	160	176	192
12	94	113	132	151	170	188	207	225
13	109	131	153	175	197	218	240	261
14	124	150	175	200	225	250	275	300
15	142	171	218	226	255	283	313	341

The wide variation in the results of these different methods can best be shown by taking a specified case. For example, assume a 12-foot log, 20 inches in diameter with a rotten core 6 inches in diameter. The allowances according to the several methods, using the Champlain rule which is one of the most accurate, are as follows:

No.	Loss in board feet	Per cent. of total
1	122	52.8
2	17	7.3
3	81	35
4	42	18.1
5	33	14.2

There is abundant evidence that the use of a carefully constructed cull table such as given above is much more nearly accurate than any rule-of-thumb method. In the use of such a table it must be remembered that it makes an appreciable difference in the amount of loss actually sustained whether the defect is a hole or a rotten core. In sawing a hollow log the cavity must be left completely boxed-in to hold against the carriage dogs and prevent the saw breaking into the hole. In the other case the rotten core prevents the shell from collapsing so that it is possible to saw closer to the defect, thereby reducing the loss.—S. J. R. in *Hardwood Record*.

Detroit Lumbermen Form a Club

The hardwood lumbermen of Detroit, Mich., have decided to form a club to be known as "The Detroit Hardwood Club." The object of the organization will be to permit closer relations between the members of the trade in the conduct of their business and between the members of the club and the Detroit hardwood lumber consumers. A credit bureau will be established for the benefit of members of the club and a number of other similar projects are under consideration.

British Columbia lumbermen were to have appointed a delegation to wait upon the Minister of Lands recently and discuss the royalty question, with a view to arriving at a satisfactory basis for fixing the rates definitely and permanently. Unfortunately the lumbermen's associations of the coast and mountain districts which held a meeting to appoint a delegation, did not bring together a quorum of members and the matter had to be temporarily postponed.

Saw Mill Bonus \$20 to \$100 per square mile—Pulp and Paper \$30 to \$130 on Graduated Scale—Stumpage Due

A fire which broke out in the lumber yard of the Canada Creosoting Company at Trenton, Ont., on July 28th, destroyed 365,000 feet of lumber, chiefly Norway and yellow pine. Fortunately the company were able to save the majority of their stock, which amounted to about 2 million feet. The plant was not damaged.

Results of Nine Log Scales Compared

Diagrams and Curves Illustrating Contents Found in Logs by Different Rules Used in Measuring Eastern Timber

By A. H. D. Ross

There are many reasons for believing that the relative merits of the different log rules in use for the scaling of saw timber will never be settled to the satisfaction of both buyer and seller. In this article, however, the purpose is not so much to set forth the reasons for this as to compare the figures given by nine of these rules for the scaling of eastern timber, and to offer some comments upon each of them.

For the sake of comparison, we will take the case of sixteen-foot logs ranging from five to thirty inches in diameter and arrange the figures in tabular form, in descending order of magnitude. This arrangement will indicate the relative position of each log rule with respect to the others and greatly facilitate the work of plotting curves which graphically show the relationships existing between the different rules.

Sixteen-Foot Logs

30	745	714	706	706	697	660	673	657	676

By plotting on cross-section paper the figures given in the above columns we get the following set of curves which shows at a glance the relationship of each rule to the others is even more convincing than a comparison of the figures in the vertical and horizontal columns.

International

In this rule the average major crook is restricted to one inch in eight feet, which includes all but very rough logs. The allowance for taper is assumed to be one and one-half inches in twelve feet, which is quite sufficient for the logs as they come in modern logging operations. The allowance for saw kerf is one-eighth of an inch, and an extra allowance of one-sixteenth of an inch is added for shrinkage and uneven sawing, thus making a total of three-sixteenths of an inch, and consequently reducing the volume of the boards sawn out to sixteen-nineteenths that of the solid contents after making allowance for slabbing and edging. For twelve-foot logs this works out to

$$\frac{16}{19} \text{ of } \frac{1}{4} \text{ of } \frac{22}{7} D^2 = .66 D^2, \text{ or } .22 D^2$$

for each four foot section. For slabbing and edging an allowance of $2.12 D$ is made for each twelve foot log, or $.71 D$ for each four foot section and all boards measuring less than 3 inches in width are rejected. Thus the formula applied to each four foot section becomes; Board measure = $.22 D^2 - .71 D$, where D is the diameter in inches of each four foot section. On this basis the scaling score is built up for logs ranging from eight to twenty feet in length (those over twenty feet being measured as two or more logs) and from three to sixty inches in diameter. Finally the figures obtained are rounded off to the nearest 5 or 0 because the error introduced in this way is abso-

lutely negligible where a considerable number of logs is measured and the work of computation is enormously facilitated.

A mill test on 402 white and red pine logs ranging from six to thirty-three inches in diameter showed that with a band saw cutting a kerf of one-eighth of an inch the theoretical scale was four-tenths of one per cent. below the actual cut. As it proved equally satisfactory for both large and small logs this appears to be pretty good evidence of the accuracy of the rule.

Champlain

In this rule the saw kerf is assumed to be one-quarter of an inch

which gives us $\frac{1}{1+4} = \frac{1}{5}$ of the volume of wood inside the bark in

the un-edged boards. Since $\frac{4}{5}$ of $\frac{1}{4}$ of $\frac{22}{7} D^2$ reduces to $\frac{1}{5}$ of $\frac{22}{7} D^2$,

and an allowance of an inch board from the centre of the log is made for slabbing and edging the formula for twelve-foot logs therefore

reduces to Board measure = $\frac{1}{5}$ of $\frac{22}{7} D^2 - D$. The great defect of the

rule is that it allows for neither taper nor crook. For first-class logs the mill tally corresponds closely with the theoretical scale, but for rougher logs it has been found that the formula $\frac{1}{5}$ of $\frac{22}{7} D^2 - 2D$ corresponds more closely with the actual cut. This last formula is the one on which the Universal log scale is built up.

Maine

This rule is based on diagrams for logs whose diameters range from six to forty-eight inches at the small end. For each log the inscribed square was first determined and outside that all boards six

inches or more in width were added—the saw kerf allowance being one-quarter of an inch. When properly applied it is a very satisfactory rule for short logs. Its scale runs higher than the Scribner but for eastern conditions it is probably as satisfactory a rule as there is. From the figures given for twelve foot logs we may derive the formula $B.M. = .6283 [(D - 1.1)^2 - 2]$, which allows for a quarter inch saw kerf and a slabbing and edging waste of 80 per cent. of the bark surface, which is sufficient for logs whose average crook does not exceed 1.6 inches in twelve feet.

New Brunswick

This rule is really a combination of the Vermont rule from 11 to 18 inches and the Maine rule from 19 to 24 inches, with subsequent extensions to include logs up to thirty inches and down to six inches. A study of the curve for this rule brings out some interesting relations between the International, Champlain and Scribner rules.

Bangor

This rule is based on diagrams which were checked by comparison with the sawyer's tallies, and is used in Maine, Vermont and New Hampshire. Its average allowance for slabbing and edging is quite satisfactory and the variations are not excessive at any point, thus making it a very satisfactory rule for saws cutting a quarter inch kerf.

Click

This rule is of a more or less empiric nature and reads "From the square of the diameter deduct $2\frac{1}{2}$ diameters, multiply the remainder by half the length of the log and cut off the right hand figure," which is better expressed by means of the formula $B.M. = (D^2 - 2\frac{1}{2} D) \times L/20$, which for 20-foot logs gives us the exceedingly simple formula of $D^2 - 2\frac{1}{2} D$.

Quebec

This is supposed to be a diagram rule but its great similarity to the Scribner rule suggests that the compiler did not rely entirely upon the results of his drawings. From the figures for twelve-foot log lengths we may derive the formula $B.M. = .6283 [(D - 1.7)^2 - 4]$, which allows for a quarter inch kerf and a slabbing and edging waste of 110 per cent. of the bark surface. On the whole the rule gives a more satisfactory allowance for surface waste than the Scribner.

Scribner

This well-known rule is based on diagrams and is one of the oldest log scales now in general use. It is the official log scale of the United States Forest Service and is used in nearly every state and province on the continent.

For logs 28 inches in diameter its figures coincide with those of the Doyle rule but for logs exceeding twenty-eight inches it runs lower than the Doyle. Its great defect is that it does not make any provision for the taper of the logs and it is a good example of the virtues and defects of a diagram rule where the results are not checked by mathematical computations or the sawing out of carefully measured logs. From the scale given for 12-foot logs we may construct the formula $B.M. = .6283 [(D - 1.8)^2 - 4]$, which allows for a quarter inch saw kerf and a slabbing and edging waste of 115 per cent. of the bark surface. For logs less than twenty inches in diameter (except very small logs) this edging allowance is too high; at 20, 26 and 28 inches it is about right; but at 34 inches the log is allowed 1.55 inches under the bark for surface waste which is altogether too high. With three-sixteenths or one-eighth inch kerfs it underscales the smaller logs. It is well to remember, however, that whilst it wanders from the correct scale at many points its values are excellent for saws cutting three-eighths or quarter inch kerfs.

Doyle

In this rule four inches are allowed for slabbing. As an allowance for sawdust waste and edging it is then assumed that one-quarter of the squared log is lost, thus leaving three-quarters of it in the edged boards. For twelve-foot logs the board measure would therefore be $\frac{3}{4}$ of $(D - 4)^2$, and for logs L feet in length $(D - 4)^2 \times \frac{3}{4} \times L/12$, which may be written $(D - 4)^2 \times L/16$ and can therefore be reduced to the form $\left\{ \frac{D - 4}{4} \right\}^2 \times L$. This corresponds with the rule "Deduct four inches for slab, square a quarter of the remainder and multiply the result by the length of a log." If a log is sixteen feet long then its board measure is expressed by means of the formula $\left\{ \frac{D - 4}{4} \right\}^2 \times 16$, or $(D - 4)^2$, a formula familiar to all who use the Doyle rule.

The fundamental defect of this absurd rule is that it is based upon the assumption that the slabbing and edging waste of small logs bears the same ratio to the volume of wood inside the bark as it does in the case of large logs, whereas it bears a much higher ratio. This is due to the well-known mathematical law that the surface of a cylinder increases directly as its diameter increases whereas its

volume increases as the square of the diameter, and the consequence is that for small logs the actual cuts enormously over-run the Doyle scale.

The Human Element in Manufacturing

No manufacturing industry in Canada is more subject to the difficulties arising out of the rapid accumulation of the scrap pile, than the planing mill business. Practically every order that is put through involves the creation of something in the way of scraps which sometimes are made into fuel and sometimes are saved to be worked up into chance orders that might arrive from time to time. Upon the successful working of scraps into something for which there is a demand, depends to a large extent upon the profitable management of many planing mills. The problem, however, is not solely one of finding an order for an article which can be made out of scraps. If this were all the problem, it would scarcely be a problem at all. Unfortunately the human element enters into the situation and complicates it greatly. To explain what we mean a recent occurrence may be mentioned.

A certain planing mill man who was always on the look out for orders which would help him reduce the scrap pile, landed one which meant the working off of a great many of small pieces of stock which had been accumulating for a long time. Several thousand pieces were wanted, about one-half inch square and six or seven inches long. Naturally he took the order to the band sawyer, telling him what was wanted and instructing him to use up the scrap pile. The band sawyer had not as much to do as usual and so the thing looked promising. He was told to work on the order whenever he had a little spare time. Then the superintendent went about other business.

In the course of time the superintendent went out to the yard and to his surprise found the band sawyer there getting some stock. He asked the sawyer what he wanted it for and was told that it was to use in getting out the order for the small pieces. Then the superintendent was angry and told the band sawyer that he was to use up the scraps, but the reply was that the sawyer did not want to go down on his hands and knees and hunt through the scrap pile for his stock. The superintendent took the job away from the band sawyer and gave it to another man, telling him he was to get the stock from the scrap pile only.

Every employer of labor will appreciate the position in which the superintendent found himself on this occasion. He had been studying carefully how to prevent loss from scraps and had found one way which promised good results, but had he not been lucky enough to find that the band sawyer was not to be depended upon to promote the firm's interests rather than his own, the result would have been a loss on the new order and the scrap pile unreduced.

The Temperament of the Workman

The human element in connection with the output of a planing mill or any other manufacturing industry unfortunately requires just as careful attention as the mechanical equipment. In fact in most cases it requires more. Workmen have given their attention so keenly to the formation of unions to protect their own interests that they have in many cases gone to the other extreme and lost their old time appreciation of the interest of their employers. This is the general aspect of the trouble. The individual aspect is sometimes even more troublesome, as it was in this case. This particular employee was of a cranky disposition. He was one of those stubborn ill-natured men who look at their employment from the wrong point of view, considering that they are doing a favor to the man who employs them, by selling their labor to him and that if it does not suit them to do things in the way that the superintendent thinks best, they have a right to do it some other way. This spirit of selfishness or laziness, or conceit, whichever one pleases to call it, is a continual source of trouble to the man who is responsible for the output of a plant. It is difficult enough in these days of keen competition, to secure business and to give satisfaction to customers. And there are times in practically every plant when the employees seem to be at sixes and sevens with their superintendents. Nothing will disorganize a business more seriously or more quickly. The work of the foreman is of course to watch for these troubles and nip them before they develop, but the keenest foreman sometimes finds himself in trouble.

From the logging operations of a lumber manufacturer to the delivery of the finished stock from a planing mill or woodworking factory, the whole process of manufacturing lumber and wood products has to face this trouble. In the woods operations today it is perhaps more serious than anywhere else, when compared with the results secured in the earlier days. Labor in the woods today is greatly inferior to the labor of a few decades ago. At the same time it is far more particular about its treatment and less considerate of the interests of its employers. It has become essential to success today that one should make as close a study of the capabilities and temperaments of employees as of the capacities of machines or the requirements of the market.

Standard or Special Sizes of Lumber?

Should Stocks be Cut so as to get the Most High Grade Out of Them, or so as to get the Most of Lumber that is Easiest to Sell?

A sawmill man who has made a good reputation for the production of quartered oak lumber has come to a conclusion which will be used in operating his plant hereafter, says the *Hardwood Record*. It is to cut as few sizes of lumber as possible. As a matter of fact he intends to confine the manufacture of oak to inch stock, except for special purposes. That is to say, if he has been shipping steadily to a particular customer 6/4 stock, he will continue to manufacture it for that trade; but will not cut and pile it, in the regular course of business, without having a definite outlet for it.

"I have found by experience," he said recently, "that while I have been cutting a lot of lumber, and have been producing no more than the average number of thicknesses, I have tended to accumulate a lot of odds and ends which I had little opportunity to move. For example, in making up a stock-sheet recently I found that I had half a million feet of plain oak, yet it was so badly split up, according to thicknesses as well as grades and lengths, that I had only a few carloads of any one item ready to ship. I found on analysis of the proposition that I have been tying up a lot of money by cutting a variety of sizes, since I scatter my efforts over too wide a field. Consequently I have determined to make but one kind of lumber hereafter, so that I can clean up my stocks with less difficulty than when the mill is cutting random thicknesses, without any definite policy on this score."

An Old Question

The question of running a mill steadily on inch lumber, for example, against a variety of thicknesses, is an old one, and much has been said on the subject. At the same time, the fact that millmen are arriving at conclusions such as that referred to, after having been hammering away at the proposition for a good many years, seems to indicate that there is still a marked lack of uniformity as to the best plan. There are some well-qualified mill operators who assert that the only safe rule to follow is to produce whatever thickness is required in order to get the best results out of the log, whether this be 1/2-inch or 3-inch stock. Their point is that the quality of the lumber should not be sacrificed to a policy of the concern as to the thickness it wants to handle, and that more will be lost in the mill in endeavoring to meet this arbitrary standard as to thickness, than will be gained at the other end of the operation by convenience in handling.

As a matter of fact, it depends largely upon the site of the mill which is under consideration. A big plant cutting several hundred thousand feet daily, can accumulate enough lumber of all grades and sizes, probably, to make it worth while to produce lumber as the character of the log suggests; in other words, to get all out of the log there is in it, no matter whether this requires cutting one thickness or half a dozen. The yard which is carrying millions of feet of all descriptions is big enough to absorb a well-distributed cut without difficulty.

On the other hand, it is not unusual to find an extremely large mill cutting only one dimension as to thickness, and usually that is inch. The obvious reason is that the operator wants to move his stock quickly, and believes that he can make more by rapid handling than by risking a tie-up of his capital through the manufacture of sizes which are not in general demand, and which cannot be moved as expeditiously as inch and some other stock. However, it can probably be laid down as a fact that the big mill can cut a variety of sizes to better advantage than can the small plant, and that the latter, unless its opportunities for moving its stock are exceptionally good, will usually find it worth while to confine its attention to a few standard thicknesses.

The Advertising Value

There is a certain advantage in being known as the producer of one thickness of lumber, just as there is in establishing a reputation as "headquarters" for all dimensions of a certain kind. There is one mill which advertises that it constantly has on hand immense stocks of a certain thickness. There is no doubt that this advertisement has made it likely that when a buyer is in the market for that particular kind of lumber, he will think of the producer whose name is identified with it. As long as production is centered along this line, there is a definite gain in linking up the demand with the mill in this way, although it is conceivable that if it were found advisable to change the policy of the concern and manufacture some other dimension, it might prove difficult to get away from the old reputation as to producing the latter.

A consideration which applies to everybody in determining upon the thickness to cut is the time required to market thick stock as com-

pared with inch or thinner. A sawmill man of long experience both in manufacturing and selling recently described an experience of his along this line.

"I had an idea that there ought to be a good market for thick red oak," he said, "and I had the mill cut several hundred thousand feet of this material. It occurred to me that I could get a high enough price for it to justify the greater exertion which would be required to move it as compared with thinner stock. However, I realized later on that it would require several months longer for this lumber to dry and get in condition for the market than if I had cut inch stock, and when I figured the interest on the investment for that period I learned that I should have to get a pretty stiff price in order to take care of that feature. By the time the lumber was ready to ship, I had discovered that buyers didn't seem to want the particular dimension I had cut, and that while I could sell my inch red oak without difficulty, the demand for 6/4 and 8/4 seemed to have gone to pieces. To make a long story short, the lumber remained in the yard for fourteen months before I was able to sell it—and the price I got for it was by no means a premium figure, and did not remunerate me for the expense of carrying the stock for that length of time. I have decided to cut inch for the most part hereafter."

Inch Stock a Staple

This point is one that is worth taking into account when the proposition is being discussed. In the case of quartered oak, for example, 5/4 and 6/4 stock is worth from \$2 to \$2.50 a thousand more than inch. The question is, does this increase more than make up for the longer period required for drying purposes, and in consideration of the admittedly greater difficulty of marketing? While it can be retorted that there is much more inch stock being manufactured than any other kind and that there are consumers of the other dimensions, especially the extremely thick stock, who are willing to pay good prices for it, the point is that inch is a staple, and can be sold without great difficulty, and that the other sizes are in a way specialties, and cannot be disposed of at a moment's notice.

The technical sawmill man, who is thinking chiefly of the proposition of making as good lumber as the log will produce, may not be willing to accept the dictum that he is to cut a given dimension without regard to the condition of the log on the carriage. He may point out that it is almost criminal to manufacture No. 1 common when by changing the thickness firsts and seconds lumber could be produced. His point is well taken, but the manufacturing of the lumber is but one of the many factors entering into the business, and is not always the controlling one.

And it must be remembered, from a practical standpoint, that it is not always easy to coach sawyers as to the exercise of judgment as to what thickness to cut; and that the production will be kept more nearly up to standard if the man at the saw has but one or two dimensions in mind, and is not trying to figure every minute what thickness should be used to keep the grade of the lumber up to the highest possible point. This may sound like a slipshod method, but in most cases it is the best one for the sawmill operator to follow.

Liverpool Lumber Market Report

Smith & Tyrer, Limited, Liverpool, Eng., dealing with the lumber trade for the month of June report as follows: Business has again been disturbed by strikes in various industries and the movement of stocks has been adversely affected. Values for most descriptions of wood are easier. Pitchpine—Hewn timber has come forward sparingly and is wanted. Sawn timber has gone lower. Shipments are coming forward too abundantly and consignments upon congested markets are arriving freely and weakening prices. Prime lumber maintains its value. Lower qualities are overdone and sales difficult. U. S. A. hardwoods have a weaker tendency and buyers anticipate a drop in values in sympathy with easier freights. Spruce deals have eased a little on account of strike difficulties which hamper the forwarding of goods, and render buyers indisposed to add to their holdings. Apart from this trouble, which should soon be overcome, there is nothing in sight to depress prices. The strike at St. John, leading to the shutting down of the city mills, should, if it lasts, stiffen the market. Birch—The demand for logs has improved, but planks are easier. Pine deals are without change. Hemlock is little enquired for. Pacific Coast woods—The demand for Oregon pine timber is readily supplied from stock, and there is little wholesale enquiry. Clear spruce and pine are offering too freely for the moderate demand and business is difficult.

Different Quarter Sawing Methods

Description and Diagrams for Getting the Best Value When Cutting Up For Figure

The accompanying illustrations, reproduced from the American Lumberman, represent the customary methods of quarter sawing and will be valuable information to file away for future use. They also will give retailers and consumers an excellent idea of the manner in which quartered oak is produced.

In Fig. 1 the small diagram illustrates the ordinary method of squaring a log and the saw cuts on the upper half of the larger figure show the relation of the circular annual rings to the boards produced by this method. The board "G" is truly quarter-sawn. Those next to it, up to "B," are practically quarter-sawn at the outer edges, but have a section which is truly flat-sawn in the center of the board, and this proportion of flat to quartered or partly quartered stock increases in the boards toward the outward edge "b." The lines "ab" and "ed" show how the log is usually split into quarters for quarter-

Fig. 1—Quarter-log method of quarter sawing.

Fig. 5—Sawing yellow pine edge grain flooring.

Fig. 6—Another edge grain flooring method. Boxing heart.

sawing, each quarter then being turned on its back and sawed, as in "a." This produces truly quarter-sawn stock at the center of the wedge and makes a sufficiently close approximation for most purposes, except at the extreme corners.

A method of quarter sawing which produces a larger proportion of more exactly quarter-sawn stock is represented by figures 2, 3 and 4. Fig. 2 shows how the heart is boxed and "B" and "C" from this diagram are then manipulated as in Fig. 3, while the portion "A" of the log is handled as in Fig. 7.

Figures 5 and 6 relate to the sawing of edge-grain flooring from yellow or Norway pine. In Fig. 5 the log is first approximately squared, and cuts 1 to 5 are then taken through the centre. The cants "a" and "b" are then piled one on top of the other and sawed together, as indicated. Approximately all of the lumber within the inner circle is sufficiently quarter-sawn to answer the purposes of edge-grain flooring. Fig. 6 shows a different way of handling the log after being squared, the heart being boxed and used for dimension, while the two pieces 4 by 12 and the two pieces 4 by 4 are sawn into flooring strips.

Figures 7 and 8 show the same method of quarter-sawing as is indicated in Fig. 1, the quartered log being turned on its back and sawed through without changing position. These figures are intended to illustrate the effect upon the figure of the resulting boards if the log, as in Fig. 8, has only half as many medullary rays. It might be remarked, parenthetically, that an oak tree of a given botanical description does not vary much in this regard, whatever may have been its growth environment. The proportion in volume of the medullary rays is pretty constant to the other or vertical cells, although it is possible that a large proportion may be of the small and inconspicuous variety and a smaller proportion of the broad thick rays which are most prominent in quartered figure. Where a number of different kinds botanically are commercially lumped together as "white oak" or "red oak," there may be considerable variation in the number of medullary rays.

Figures 7 and 8 emphasize the need for careful selection of wood for quarter-sawing purposes. A reader commenting upon these figures states that if the poorer log shown by Fig. 8 had been sawn into wedges of one-eighth instead of one-quarter and each of these wedges

Fig. 7—Effect of close rays, quarter-log method.

Fig. 8—Effect of scantier rays, reducing figure.

Fig. 9—Quarter-sawing by successive tilts of half-log.

Fig. 10—Plain-sawing diagram.

had been sawn into lumber, the average resulting figure of the boards would have been superior to those shown from the better log in Fig. 7 by the quartering method. This, of course, is because in the narrower wedge all the boards approximate more closely to true quarter-sawing. Yet it should be remembered that at some point in the process the increase in labor and waste overbalances the gain in quality.

Figures 9 and 10 illustrate the sawing methods used by a New York State firm, Fig. 1, of course, representing plain-sawing. A little study of figure 9 will show that the log, in effect, is divided into 12 wedge-shaped sections, each of which is sawn up parallel to one of its wedge faces. As regards the product this is equivalent to sawing the log into six wedges and sawing each wedge parallel with its center line. Inasmuch as the method described above by a reader divides the log into eight wedges instead of six, sawing each parallel with the center, it approximates true quartering more closely than does diagram 9.

In the above remarks it is not assumed that the log is actually divided into 12 wedges as an initial operation, because undoubtedly each half of the log is progressively canted or tilted upon the block in the method of sawing figured by this diagram.

The Retail Dealer and His Problems

Collection of Accounts—Commissions to Contractors

Cleaning Up Accounts Which Are Due

Knowing as I do that this subject is occupying the thought and attention of every dealer in the country just now, more than any other thing about his business, I feel that I am warranted in endeavoring to suggest something that will be helpful in reducing the causes for this annual period of worry. We are influenced by what we read more than we realize and many of our subsequent actions may be traced to ideas absorbed from a forgotten source. I know that we ought to keep at our collections all the time. That's what they used to tell me when I was manager. But somehow there were times when I was more interested in making sales than I was collecting for what I had sold and when the time came that I was reduced to a few weeks to get in my accounts I often wished somebody else would take the job off my hands, writes C. H. Ketrige, in the Mississippi Valley Lumberman.

Believing as I do that there are a number of dealers who are now feeling the same way, I want to talk to them of a project that I've heard of that has been found to be both practical and successful in not only collecting the accounts, but relieving the dealer of the unpleasant features that are associated with the employing of others than himself to collect them. Farmers, especially, as you know, are inclined to be touchy about being dunned by a special collector. The scheme, as I have heard of it, has been tried and satisfactorily worked out by a dozen or more business men in a small city, who had enough of the co-operative spirit to join with each other to use the local bank as their collector of all unpaid accounts after the 15th of each month. If I remember right, nearly all the coal dealers went into the scheme, because the nature of their business is such that it is not profitable to carry coal accounts over thirty days. But the project will apply equally well to accounts for building material that are given a specified time for payment. The general run of accounts is supposed to be due the first of the month following, but a further time of fifteen days is given them, and if not paid then, they are turned over to the bank who at once sends out notices direct to the customer, and keeps on following them up till they are paid or otherwise settled satisfactorily.

Want to Keep Their Bank Credit Good

The bank is supposed to use no partiality, but treats all alike. There are several advantages to this plan. The dealers have the use of the bank's sources of credit information, which even in a small town, is better than any individual business man has. Another is, through the desire of everybody to stand well with the banker even though they are in poor standing with the rest of the business men of the place. This desire acts as a compulsion on them to effect the more prompt payment of accounts.

I am favorably impressed with the practicability of this plan, and if all the business men in a town would unite in going into it, it would not only save them a lot of trouble, but it would have the effect, as well, of teaching the people to be more careful about running into debt. Most any business man could afford to pay the bank a small commission for collecting what he himself has difficulty in doing, and the use of the money would be worth more than the trifle of expense.

I think I would recommend this plan for small places where it was not found feasible to maintain a local credit organization owing to the local jealousies of the business men. Men will have confidence in the bank when they won't trust each other. But where the conditions are favorable, I prefer having the merchants co-operate for the control of their credits, because, in addition to the main purpose, a better feeling is created among them which will find expression in other ways for a mutual benefit. It has the effect also of solidifying the forces of the town in working out anything of the nature of a public enterprise, for let me tell you, when men get chummy enough to interchange information about slow pays and dead beats, and will work together to lessen them, they will harmonize on pretty much anything else of a public nature.

The greatest benefit that such an organization is to the business man lies in the advantage it gives him in knowing whom to give credit. It is easy to say that the best way to prevent having bad accounts is not to make them, but it is safe to say that ninety per cent. of those we do make would not have been made if we had known beforehand of the character of the men we were selling. Therefore it is plainly obvious that any scheme or plan whereby we may know of those of poor credit, cannot but result in a substantial financial benefit.

"I didn't know he was that kind of a man," is the general answer

to the question, why we had trusted him. The fact is, it was our business to know. But again, how is it possible to do so singly and alone, especially if we have been but a year or two in the place?

Sources of Credit Information

There are three sources of credit information open to the new comer. The first is the local bank, whither all strangers go for such information. Now, as a matter of fact, a bank reference is not always a safe thing for a business man to rely on in cases of this kind for, as I have already stated, a man will endeavor to keep in good standing with the bank, though his credit may be at a low ebb at the stores and other places.

The second source open to the newcomer is the general store where he has started in to do his trading. The merchant will no doubt be willing to give him of his knowledge based on his own experience, but necessarily this is limited to those who have traded with him. Now then, supposing he could have access to the information that all the merchants could give him through a local organization, how much sooner he would get into the credit "ropes" of the town, and what a lot of worry and trouble it would save him in the future.

The third source of credit knowledge is that which comes from his own personal experience, and every bit of it he pays for in one way or another, and every year he is in business at that place he learns something of the credit of men that he didn't know before, but which his neighbor competitor could have told him.

I have often thought that perhaps the losses that merchants suffer from giving unwise credits is but one of the ways nature has of evening up things between the rich and the poor; the strong and the weak. What would a lot of poor devils do if they couldn't "run their face" for something to eat, wear, and keep them warm? It looks as though we were bound to give of our substance to somebody whether we will or not, and so it has become an essential part of our business life to be ever on the alert, and watch that we don't lose any more than possible in this way. Everybody is studying and striving to accumulate, and there are others doing the same to separate it from them without rendering a just equivalent. Sometimes it is the way it is done that hurts. We may lose ten dollars on an election bet without feeling it much, but if the same fellow gets into us for a ton of hard coal this winter and beats us out of it, we will lie awake nights studying some way to get even with him.

I have noticed in my years of experience and observations the well meaning carelessness of many people in paying out money and receiving it. It is prevalent everywhere, but I think it is a little more so among the business men in a country town than in the city. It would be surprising if it was known how few receipts are given for the payment of money and settlement of accounts among country business men. Many a time have I seen an account settled in a store and a receipt not given unless it was asked for.

"Scratching It Off the Books"

Is enough for the average customer without seeing that it is done. And the merchant is satisfied to do it without going to the further trouble of writing him a receipt. So the habit of not giving one has grown so that the request for a formal receipt by a customer comes as a slight shock to the average merchant. In fact, in the earlier period of my business experience, if a customer asked me for a receipt for the money just paid me for a sale, or settlement of account, I thought he was extra particular, or doubted my giving him credit on the book, and for the latter, I felt a little resentment. But in the light of a better knowledge of business I have seen how foolish I was to entertain such a feeling. As a matter of fact, a receipt is due to every one who pays cash for a purchase or the settling of an account, and modern business methods include the giving of one, whether the customer asks for it or not. This is made more possible and easily done by the use of the ticket machine which records all purchases and shows whether they are paid or charged on account. It is astonishing how universal is the use of these machines in the city. It is either those or a cash register in every place you go. Whether you pay for goods or services rendered a record is kept of it in one or the other of these machines. You will see a cash register in any bootblack stand or a cobbler's shop, and I've no doubt that these recording machines are becoming more prevalent in the country towns.

Nowhere is a ticket machine needed so much as in a retail lumber and coal office. I found it so essential in my period of business here, that I don't know how I could get along without one. It would be like going backward to try it. Many a dispute and many a dollar

have I saved, through being able to produce from my files the itemized records of such transactions.

I was spared a lawsuit once by being able to produce the ticket showing that I had delivered a certain amount of stuff on a job, signed by a party on that job. In settling up for bills furnished to either owner or contractor there is most always one or more items that the parties think a mistake has been made on because their account don't tally with yours. The probabilities are in favor of your account being the correct one and the discrepancy is caused by the failure of the other party to record the charge or the delivery, as the case may be. But if you can produce the proof of the delivery and the receipt for it, the bottom falls out of the dispute. You will have more or less of disputes of this character during this month of settlements, and the showing of a receipt will settle all of them as far as your liability is concerned. We know, too, that we ourselves are liable to forget and overlook such things as the recording of stuff going out on bills, payment of money on small accounts, and such matters, in the rush and hurry of a big day. Afterward, when writing up the books you are conscious of having someone giving you money during the day to apply on their account, and you can't for the life of you recall who it was. Now, if you could turn to your ticket machine, and saw the record there of the transaction, your worry is ended, of course. You may say that a book entry could be made as well as writing it on the machine ticket. The fact is, however, when one has a machine he gets into the habit of giving and taking a receipt for everything that comes in or goes out, whereas, without it, he is more apt to let a matter go till he gets in the office where his books are and therein lies the chance of forgetting it.

Cause Unpleasant Complications

In the more free and easy ways common to a country town, there is a general carelessness in money matters that often is the cause of unpleasant complications. You find it not only in business transactions, but you see it also displayed in the affairs of the different organizations that are supported by subscriptions, fees and dues. Slipshod ways in running the financial part of an organization are often the cause of serious trouble among its members. The by-laws of any of them provide that all moneys are to be paid to the secretary or treasurer and he to be held responsible for them. He is supposed also to give a receipt and take one for all he takes in or pays out. You and I who have had experience in such matters, know that this is not always done and hence the frequent assertions of having paid dues, but having no receipts to show for it. Dues also are paid and a receipt given but the payment is not credited. There is no bad intention in the matter, but only pure carelessness on the part of those entrusted with handling the finances. Money for dues is handed them on the street or some other places; they have not the proper receipt book with them and therefore cannot give one. A week or two may elapse before they all get to their desk in the lodge room, and there is a chance that it may be forgotten altogether. Money is handed also to other officials than the right one at all times and places, and there is the chance that he may forget who paid him.

I have had the experience of auditing the books of two different lodges. One of them had been running for seventeen years and in order to make a thorough job of it I had to commence at the beginning of its existence. Some of the secretaries had been good business men and their records were straight. Others were incompetent and careless, making it necessary to go through the whole for a correct result. It is unnecessary here to go into details of what I found. Suffice it to say there was a shaking up of things in that lodge. The other lodge had been organized but a few years, but I found a worse state of affairs in this respect than in the first. Since then I have learned of a similar state of things in other lodges and organizations, and I don't hesitate in saying that the majority of such in both city and country towns alike that have been running for a period of ten years, will be found to be conducted in the same careless incompetent way.

Loose Bookkeeping Among Business Men

There is a good deal of loose bookkeeping also among business men. I have found as much of it here as I did in the country towns I've lived in. The main trouble is that the average business house is not willing, or thinks it can't afford to pay a good salary for a competent bookkeeper and the result is there comes a time when they don't know where they are at, and have to employ the expensive services of an expert accountant to get them out of the hole their parsimony has dug for them. A cheap bookkeeper is liable to be the most expensive employee in the whole concern, and largely for this reason, expert accounting is a business by itself and gives employment to a good many men.

I presume there is scarcely one among you who reads this, but who at various times has been called on to pay a bill that you know you had paid. It is probable also that you too have presented, or sent out a bill that has been paid, so you feel somewhat charitable towards

the party who has dunned you for a paid bill. It is a common experience to have a customer claim he has paid you more on an account than he really did. It is your book against his memory unless he can produce your receipt for it. He may have paid you the money at some place other than your office, and unless you made a memorandum of it in your note book at the time, it is his memory against your memory. To say the least, this is embarrassing. If the customer persists in claiming his right, you have no proof to show he is mistaken, other than your books, and if the amount is not large it won't pay to sue it if he is a valuable customer and favorably known as one who pays his debts. If you lose the disputed amount, the lesson you learn is worth what it costs.

I bought and paid for the same kind of a lesson and it has stayed with me ever since. I said at the time never again will I be caught this way. Previously I had been as careless as the average business man about taking money whatever and whenever it was offered me, without giving a receipt or making a note of it till I got back to the office. There are times when you run a risk in not taking money on account when it is tendered you, but from the time I speak of I always carried with me a small receipt book, so that if I ran across any man who wanted to give me money right then and there I would know by the stub what he had given me when I returned to the office. I have never had any trouble from that source since, and I would recommend the doing the same to every one who is running a country yard. I have been secretary of several organizations and I made it a practice to refuse taking all money for dues except at the office where I kept the receipt books. The members thought me cranky about this at first, but their better sense told them I was right in the matter and before long they were educated up to my way of doing. Of course, we feel complimented by having people handing us money without a receipt. It shows their confidence in us, but too much of such confidence is a breeder of carelessness.—C. H. Ketridge.

Commissions to Contractors

We have recently published in this department several communications discussing the so-called "contractor" problem. In the small towns and villages the contractor is really a country carpenter who usually sells his services by the day and does not do a contracting business such as is performed by a metropolitan contractor. There is no reason why the retail lumberman and the local builder should not remain on friendly terms and co-operate with each other because there are many ways in which each can help the other. Both serve a common constituency. The lumberman furnishes the material which the contractor uses in the erection of various structures, says the Mississippi Valley Lumberman. Several dealers have testified that they have found it good policy to contribute five or ten dollars occasionally to the contractor in order to secure his good will and co-operation, while others have been paying regular commissions to the local builder for any business which was secured through his influence. Other retail lumbermen have given the contractor a concession on any material which he buys, or neglect to charge for many small items which the local builder might need for his own use.

Everyone admires the individual who will stand up and manfully fight for his rights and everybody despises a coward. We believe the time has come for the retail lumbermen to take a firm stand and refuse to submit to extortions or impositions by the local contractor. If those individuals perform certain services for the dealer, they are entitled to a reasonable compensation, the same as other persons. In a majority of cases the local builder owes the lumberman a substantial sum and in many ways is dependent upon the dealer for the success of his vocation.

If these so-called contractors are not willing to be fair and honorable in their dealings with the local lumberman, the dealer can establish a building department which he can carry on with the assistance of some first-class carpenter. In the large cities there are thousands of good mechanics who have had a thorough training in building lines as foremen or assistant foremen, many of whom would be very glad to get an opportunity to move to the country if they had a good position offered them. Several of the lumbermen who have established building departments have been well pleased with the results of the venture, and which has not proved profitable but has stimulated the sale of building material. A few of the large line yard companies have employed first-class men, capable of directly overseeing all kinds of building, whose services are used wherever a substantial contract is secured. Assistants are employed wherever they are needed and they are being trained to handle the ordinary contracts without assistance. The establishment of a building department by the retail lumberman has a very wholesome effect upon the blackmailing contractor.

An enterprising retail lumberman who has had his trade seriously injured because he declined to accede to the demand of a hold-up contractor concluded to force the fight into the open and has recently sent to every prospective consumer in his territory a letter which tells a lot of plain truths.

3 in.-4 in. COMMON LUMBER 10 in. and

The Latest and Most Modern Method
Price for Common

A Cost of 75 Cents per Thousand Feet Board Measure

In many sections of the country, East and West, in spite of the utmost care in sawing there accumulates a vast amount of common lumber, 3", 4" and even 6" wide, which at times is almost impossible to move without cutting the price several dollars per thousand. Most lumber manufacturers would be satisfied were it possible to obtain from their narrow width common lumber the actual cost and, in most instances, in order to move the accumulated stock quickly they are compelled to sacrifice.

By the Linderman method two 4" strips can be joined to make 8" shiplap at a cost which will not exceed 75c. per thousand feet, and a comparison of the figures between 8" shiplap and 4" common lumber at what it is sold for, adding to it the cost of joining it together by the Linderman method and the cost of milling it, leaves a net increase in price of from \$2.50 to \$4.00 per thousand. 10", 12" or even wider widths can be built up in the same manner and at the same cost per thousand, no matter whether the lumber being worked is spruce, hemlock, fir, cedar or pine.

Narrow lumber can also be joined together for rough sheathing, partition work, barn or subflooring and other purposes.

There are Eight Different Lengths of Linderman Machines
Ten, Twelve, Fourteen and

CANADIAN LINDERMAN COMPANY

BER Converted into 8 in., 2 in. SHIPLAP

for Obtaining a Greatly Increased
on Lumber

ds a Return of From \$4.00 to \$5.00 per Thousand

Shorts and odd lengths can be joined to narrow widths, making a composite board of any length desired up to 16'. This is accomplished by running a binding strip on the outside the full length desired and joining to it two or more pieces of miscellaneous lengths that will equal the length of the binding strip. To this can also be joined another series of short lengths so arranged that the butt end joints will not come opposite one another and to this then can be joined the second outside binding strip. Such a composite board will show tight joints not only where they are joined together on the edges but the butt ends of the boards will be tight, making a board as strong and stronger than the natural wood. Such a product, while it may not bring a price equal to a wide board of the same dimensions, will yet yield a profit of several dollars per thousand over the cost of manufacture. In this way the cuttings from the flooring machines or from the sawmill can be converted into a marketable product instead of as now being sold as kindling or sent to the burner.

Full information and particulars in detail will be gladly given and we will arrange to work samples of your own stock if you so desire.

The Orderly Small Planing Mill

By T. C. James

Order and system are just as important, and often easier to get, in the small planing mill than the large one. There are fewer complications involved, thus the system can be shorter and the manager keep in closer touch. An excellent type of the smaller mill is illustrated herewith, says the Wood-Worker, Indianapolis. The company didn't want to operate a planing mill, but, like many other retail lumbermen, found it must have a few machines and benches to take care of special work. It erected a one-storey building, about 40 or 45 ft. wide, 120 ft. long, with a concrete floor, and arranged the machines as shown in the accompanying sketch, so that the rough stock starts in at the end next the stock shed, makes a complete circuit of the building in regular order, and comes out where it started, and where it is also handy to either load directly on the wagon or put into the stock shed until needed.

The floor plan of this mill, given herewith, is not made to exact measurements, but is a rough sketch of the relative positions of the machines. So some of them may be "out" a little, but they serve to show the scheme and the number and kind of machines. Beginning at the driveway entrance, there are grouped the rip saw, the surfacer and the cross-cut bench, which has a swing saw over it; then comes a table saw, universal wood-worker, with about six or more machines combined in one, including jointer, shaper, band saw, mortiser, etc. Farther along is a post-boring machine, the sticker, a top smoother and jointer, a drum sander, a belt sander and a grinder, while coming back on the return side of the mill is a row of six work benches and plenty of elbow room for handling stock and putting it together.

Up at one corner, inside the mill proper, will be noticed a little stock room, in which are kept nails, properly racked in box bins, hardware, paints, oils, etc., while down by the rip saw, outside, is a scrap stock room with a series of stalls, in which the scrap from cuttings is kept in an orderly manner, so that any part of it can be gotten at handily. The result of this arrangement is that after a year

Floor plan of well-appointed and arranged small planing mill.

of work there is not much more scrap left in there than would ordinarily be found at the end of a week's run. It is kept worked out, so that the scrap pile is a live asset and not a dead junk pile.

A bigger thing than the mill itself in point of territory covered is the stock shed, which, together with the mill building, forms a sort of "T," with the top longer than the stem, and a space between where the stem should join onto the top. No stock whatever, except that being work on, is carried in the mill, but out in the stock shed is carried the finished stock from the mill, rough lumber stock for the mill, and standard stock in mill work that is bought already manufactured; and this stock shed is fully as interesting and important as the mill itself. In the first place, everything the concern can buy already manufactured, is carried in stock. This means not simply doors and sash, for those are really taken care of by a special arrangement, but casing, base, frame shooks and occasionally ready-made window frames, stock mouldings in both soft and hardwood—and some of this is in dust-proof bins.

The shed has a driveway through it lengthwise, and another crosswise, through which wagons can come right in to the end of the mill for loading when desired, and running along the outside is a railway sidetrack from which to take lumber right into the building direct from the cars.

One end of the stock building is given over mainly to rough stock for the mill, the softwood on one side and hardwood on the other. And every bit of lumber is sorted for both length and width as it is put in stock, and all of it, even the oak, is thoroughly kiln-dried before it goes in. Then when a man wants one or any number of pieces of a given size for the mill, there is not a job of going out into the yard and tearing down a pile, but the stock is right there under shelter, in separate bins, and he can go get what he wants without trouble or delay. This stock shed, in this and some other features, is the nearest thing to the ideal arrangement the writer has ever seen. It carries out ideas advanced heretofore of keeping rough

stock under shelter, makes it convenient to get at, and easy to keep track of.

In the other half of the shed is carried standard stock in mill work and the stock from the mill that is waiting to go out on the job. Here there is a simple blackboard and bulletin system, the result of an idea of one of the juniors in the work. On every post in the spaces for jobs there is posted a blackboard, on which the man taking material from the mill to the stock room writes the name of the job it is for, so when the shipping clerk comes along he has but to glance at the blackboards to see whether a certain job is there or not, and to find just where it is. Then when he sends it out he crosses out or erases.

Another and larger blackboard, in the form of a bulletin tickler, is now used, too, one for the mill foreman and one in the office, as a reminder and to furnish quick information about how far the work has progressed on any job. This board is about 2½ x 4-ft., and is cross-ruled, with starting space for the contract or order number and five spaces for checking. One space is for rough lumber, one for outside trim, one for flooring and one for finish. When the shipping clerk sends out rough lumber on a job, the job or contract number is posted, and he makes half a cross-mark in the beginning to show that he is working on it. This tells the mill foreman that the job is under way and that it is about time to start in on the mill work of that job; and as the work progresses it is a standing reminder and informant. Meantime a duplicate board is kept in the office, and from time to time the shipping clerk checks it up to correspond, so that the man in the office, if he has a telephone inquiry, does not have to go hunt up somebody or some record, but can glance at the bulletin board and tell at once just what shape the job is in and how it is coming along.

All this may sound to some of you like talking system more than machines, and it is, for the idea is to show the systematic handling of work in a modern small mill. It is well for every mill man to give attention to the fact that there is handling of stock both before and after the milling, and in this handling, as well as in the milling, there is a chance to either make or lose money according as it is done. This is a sample instance of how it is done about as nearly just right as one can find.

How to Bundle Hardwood Flooring

The proper method of bundling hardwood flooring is a point upon which some people will disagree, as local conditions always come into play. A Michigan firm recently sent out an interesting trade circular showing how it bundles flooring, the information in which will be useful to others and to purchasers of flooring. Here is their schedule:

- 13/16 x 1½ in., all lengths, 12 pieces.
- 13/16 x 2, 2¼ and 3¼ in.—2 to 5½ ft. lengths, 12 pieces; 6 to 16 ft. lengths, 6 pieces.
- 1/2 x 2 and 2¼ in.—2 to 5½ ft. lengths, 24 pieces; 6 to 16 ft. lengths, 12 pieces.
- 3/8 x 1 in.—All lengths, 24 pieces.
- 3/8 x 1½ and 2 in.—2 to 5½ ft. lengths, 24 pieces; 6 to 16 ft. lengths, 12 pieces.
- The 13/16 x 2, 2¼ and 3¼ in., 2 to 5½ ft.; 1/2 x 2 and 2¼ in., 2 to 5½ ft.; 3/8 x 1 in., and 3/8 x 1½ and 2 in., 2 to 5½ ft. bundles, are double in size and each one is counted as two bundles on our tally sheets.

On the same circular is involved a measurement table which is as follows: Multiply the total lineal feet of the bundles by the proper number shown in third column of table and the product will be the total feet flooring, board measure.

Size	Pieces in bundle	Multiply by	Add
13/16 x 1½	12	2¼	50 per cent.
13/16 x 2	6	1¾	38 per cent.
13/16 x 2¼	6	1½	34 per cent.
13/16 x 3¼	6	2	24 per cent.
1/2 x 2	12	2½	25 per cent.
1/2 x 2¼	12	2¾	23 per cent.
3/8 x 1	12	1½	50 per cent.
3/8 x 1½	12	2	34 per cent.
3/8 x 2	12	2½	25 per cent.

To estimate the number of feet required to cover a given number of square feet area, add to surface measure the percentages shown in last column of table.

S. P. Musson, Son & Company, Barbados, in their market report under date of June 20th, say:—Lumberstuffs—White pine—The position is unchanged since our last. There have been no arrivals to report during the fortnight, and stocks are greatly reduced. Several cargoes have been sold to arrive at \$34 for merchantable and \$26 second quality. Spruce—No arrivals during the fortnight, but supplies fill requirements. Pitch pine—No receipts. Shingles—Stocks are light, and first arrivals should sell to good advantage. Wood hoops—400 bdls. of English have come to hand by London steamer.

Rip Saws and Wood Workers for the Lumber Yard

The lumber yard which hasn't a rip saw or combination wood-worker is not up-to-date unless it has a planing mill as a side issue where all this work can be done. It matters but little whether a man is in the city, in a large country town or a small one, we have reached the point where some kind of power wood-worker machinery is almost essential to doing business as it should be done.

There was once a time when the wood-working establishment in connection with the lumber yard was regarded as a time and money-waster instead of a paying investment. That time has passed away and the planing mill of today is a proper paying institution and a much better proposition generally than it was ten years ago. The trouble with it all is that the trade has retained too much of the old idea that an effort to install power-driven machinery for converting lumber is a start toward wasting money.

There are many reasons why this is not so today as it once was. For one thing, even the planing mills have been put on a better business basis. Planing mill men have reduced the art of estimating to the point where they can figure out their work in advance and make fairly sure of reasonable profit from their business.

Power Problem Easy

The rip saw and the combination wood-worker in the lumber yard is, however, entirely separate and apart from the planing mill proposition except in that one naturally thinks that it is an opening wedge to adding a full planing mill equipment and fight shy of it on that account. The lumberman who hesitates today at putting in such machinery should consider how time and its changes has affected this business. It is no longer necessary for a man to put in a steam power plant of his own with all the consequent fire hazard and expense of a fireman or engineer. Today he can get power units of any size, from one or two horsepower up. He can get his power in the form of electric current where there is a local electric plant, which is true of most all cities and larger towns. In the smaller towns where there is no electric current available he can supply power in the form of gasoline or oil engines. This class of power is dependable today and economical.

Also through its extensive use in driving automobiles and motor trucks every man is fairly familiar with it and does not feel the need of employing experts to operate these explosive or internal combustion engines. When they are not at work they cost nothing, and when they are at work, they furnish power that is comparatively cheap.

Just what a man may need in his lumber yard or shed in the way of equipment of this kind depends considerably on whether he does simply a lumber yard business or whether he contracts, and somewhat on whether there is a local planing mill.

Illustrating What Can Be Done With a Rip Saw

For shed service a plain, cheap rip saw table will prove a wonderful convenience. Perhaps the best illustrative story of how and why is one given by an old yard man located on the edge of quite an important city with several planing mills within reach. This man, for the convenience of local carpenters, finally concluded to put in a rip saw. Sometimes they wanted several strips of special sizes or dimension that were not carried regularly in stock and the original idea in putting in this rip saw was to simply make it a matter of accommodating carpenters and contractors. There was no thought of making direct profit out of it. It was considered as an investment to hold the trade of the carpenters, and it was located in one end of the shed near the office so that the proprietor himself could go out and look after the ripping out of these special accommodation orders.

It served its purpose, too, and was worth several times its price simply as a matter of accommodating carpenters and contractors. Also it was found that it helped serve the country trade. The farmers coming in and discovering this saw and rippings around it were reminded of certain strips and special stock that they could use conveniently. So, by and by, it was helping secure the country trade as well as the contractors' and builders' trade, and, indirectly, by this means it helped hold these country customers and helped sell lots of lumber that might otherwise have been sold by a rival yard.

By and by this yard man found his little rip saw helping him out otherwise. One day he ran shy of 2 by 4 by 12. It happened that he had plenty of 2 by 8 by 12, so with these and his rip saw he soon made what 2 by 4's he needed. Then he got to figuring on the matter and found that he could buy his 2 by 8 by 12 cheaper than the 2 by 4 by 12, and was actually saving money by ripping these when he needed them.

Was the Nucleus of a Plant

Many other times it helped him out on other dimension stock, too. He was able to reduce 2 by 8's to 2 by 4's and, at times, to reduce a bad 2 by 6 to a good 2 by 4 with a bridging strip in the trimmings. Then he found that he could work defective joists up and get some good smaller dimension out of them, and from the scraps he could make up bridging which he afterward cut to a specific size and

sold for more money than he could have gotten out of the same amount of good framing lumber.

The final result of it all was that this little rip saw grew into a sort of pet or hobby and became the most interesting and valuable asset of the business. By and by, this man bought other machinery, and he eventually equipped a fairly good vest-pocket planing mill in which he could do such odd work as making transoms, store fronts, special sizes in sash, and things of that kind; yet he put this planing mill in a separate building and developed it as a business of its own. All the time, even with this planing mill close at hand, he kept this one little rip saw in the end of his shed for the convenience of customers and for the benefit of cleaning up and utilizing stock out of his yards, and it continued to pay returns, too, just as if there were no planing mill equipment near.

Use a Wood-Worker on Jobs and in Yard

This man did a lumber business and no contracting whatever. Another successful retailer who got along for years and years without anything in the way of machinery to help him out finally concluded to add something of this kind. He does a contracting business, as well as a lumber business, and for his work finally decided on one of those combination wood-workers, which included a number of different machines on one frame. He is in a small town with no electric power available, so he bought his wood-worker with a gasoline engine installed right in the frame and the whole thing mounted, so that it could be readily moved from place to place. He, like many a contractor, makes use of this machine right on the job, where it not only saves lots of hand work, but it can be made to do a fair share of work that belongs to the class called mill work and which he would likely otherwise have to order from some planing mill and have shipped in by local freight. It has proven a good investment all around and, of course, when it is not out on some job, it is on the yard or in the shed, where it can be used for working up yard stock in pretty much the same manner as the rip saw referred to above.

This lumberman and contractor will perhaps find eventually, however, that it will pay him to install a simple rip saw to be on the job in his yard or shed all the time, in addition to his machinery for taking out on contracts. Once a man tastes of the convenience of a rip saw table in his lumber shed he never wants to do without it even for a day, and it matters not how much other machinery he may add for taking out on contracts or for doing planing mill work, he will always find it handy and worth the price to have one of those little table rip saws that can be stopped and started in a minute and can be used in a hundred different ways in connection with a lumber yard.

Many Power-Driven Appliances on the Market

There are many power-driven appliances being offered for the convenience of the lumberman, the contractor and builder, and the progressive retailer should keep himself informed about these and make it his business to buy such of them as give promise of proving useful in his work. That is the way to keep up-to-date today and head of the game. There are any number of combination wood-workers that are almost complete vest-pocket planing mills within themselves, and the rapid growth of the offerings in this line is pretty good testimony to the success which has been attained with their use.

The carpenters and contractors who read their trade papers are informed about and being besieged to buy these rip saws and combination wood-workers. It behooves the lumberman, therefore, to get into the game first, prepare himself to serve all the needs of his customers in the way of dimension stock and odd jobs of mill work. Carpenters and contractors will buy some of these machines anyway, and, here and there, where the retailers neglect keeping up with these things, the contractors may keep adding equipment of this kind until they get a fairly good planing mill of their own, and through this means qualify as wholesale producers of lumber, which means a customer lost to the retailer and a possible rival in the future. Some of this will come anyway, but the more progressive the retailer is and the more equipment like this he gets in himself, the less likelihood there is of his customers buying machinery and drifting away.

A report from Quebec states that the Degrasse Paper Company, in conjunction with the "New York World," have purchased from Mr. D. H. Pennington, of Quebec, his pulpwood limits at Murray Bay, comprising 52,000 acres. The price paid was \$400,000. Mr. Pennington has taken out about 50,000 cords of wood off the limits annually for the purchasers. These limits formerly belonged to the Bonners, of New York, an old Quebec family.

H. R. Reid, vice-president of the Labrador Pulp and Paper Company, reports that the company now has two large sawmills at work at Hamilton Inlet and has started construction on a large pulp mill at the Inlet, which will have a yearly capacity of 90,000 tons. The company also intends to erect another mill with a capacity of 50,000 tons annually, but wishes to have a partial outlet for the larger plant before it begins building the smaller. The British Wall Paper Company will take the largest portion of the output.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4 1/2 in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.

- 1 x 1 x 42.
- 1 x 1 x 48.
- 1 x 1 1/2 x 42.
- 1 x 1 1/2 x 48.
- 1 x 1 3/4 x 42.
- 1 x 1 3/4 x 48.

Require Thickness, 1/16-in. Plump.

Quality—Free from all defects.

Can take delivery of green or dry stock.

Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

Wanted Building Lumber

To sell by active man, middle age, practical experience selling building lumber and hardwoods. Thorough knowledge of credits and collections. Efficient and competent to handle large transactions. Now employed selling in New Jersey and Eastern New York. Want a position offering opportunities for advancement. Address Box 836, Canada Lumberman, Toronto, Ont. 15-16-17-18-19-20

Wanted To Buy

We are in the market to buy the following lumber:

- 1 carload 1 1/2-in., 1s and 2s, dry quartered Rock Maple, 5-in. and up wide, 8/16 ft. long.
- 1 carload Rock Elm.

Also Hickory squares, as follows:

- 100 gross 26-in. x 1 1/2-in. first growth.
- 1 car 26-in. x 1 1/2-in. x 1 1/2-in. second growth.
- 1 car 26-in. x 1 5/8 x 1 5/8-in. second growth.
- 5 cars Plain White Oak, various dimensions, 6-in. and up wide.
- 2 cars Rock Maple, various dimensions, 6-in. and up, average 9-in.
- Rock Maple logs, 20-in. to 23-in. diameter at small end.
- Rock Maple logs, 24-in. to 30-in. diameter at small end.
- White Ash logs, 10-in. to 18-in. diameter at small end.

State best prices, net cash. Delivery to be made as much as possible this season, balance next. Apply P. O. Box No. 1595, Montreal, Que.

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

WANTED BY EXPERIENCED MANAGER

A position in charge of woods or manufacturing, or both, which will pay five thousand or more a year. Address Box 822, Canada Lumberman, Toronto, Ont. 13-16

Position Wanted

Any good lumber concern in Canada desiring services of young lumberman, experienced in spruce and white pine manufacturing, both in woods and at mill, also selling in all Eastern and New York markets, but preferring to live in the woods part time. Familiar with every department, lumber office work and good accountant. For further information and credentials establishing genuineness of applicant, apply Box 841, Canada Lumberman, Toronto, Ont. 15-16

Man of wide experience in lumber business, saw-planing mills and box factories, open for position in office or mill. A1 references. Apply Box 843, Canada Lumberman, Toronto, Ont. 15

WANTED—Position as Lumber Salesman with good company; have had 18 years experience, good connections and capable of taking full charge of sales department. Address Box 838, Canada Lumberman, Toronto. 15-16-17-18

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Overall Salesman for Eastern Canada. Experienced, capable, good acquaintance. Apply Box 842, Canada Lumberman, Toronto. 15

WANTED—A good machinist for our Crossburn Railway Shops. Apply to Davidson Lumber Company, Limited, Bridgewater, N.S. 13-16

WANTED—First-class walking boss for bush operations. State age, experience, habits and salary expected. Apply, Box 812, Canada Lumberman, Toronto, Ont. 12-17

WANTED—A salesman to cover the Canadian territory who is a live one and knows the hardwood trade. Must be thoroughly posted on West Virginia and Southern hardwoods. Straight salary and expenses. Apply with full particulars to Box 827 Canada Lumberman, Toronto, Ont. 14-15

WANTED—Good reliable man to take charge of set of books and act as secretary and treasurer of a company in Ontario, to a party capable of filling the position and being able to take an interest in the company a good paying position will be given. Box 833 Canada Lumberman, Toronto, Ont. 14-17

Salesman Wanted

Lumber salesman having good knowledge of Pine and Hemlock, and who understands grades and prices for Ontario trade. State age, experience, salary expected and furnish references. Services to commence August 15th. Address reply to Box 828, Canada Lumberman, Toronto, Ont. 14-15

Business Chances

Wanted

Contract of cutting lumber. Have experience. Three hundred thousand and up. State full particulars. W. E. Rutledge, Newmarket, Ont. 15-18

Wanted Practical Lumberman

Wanted a thoroughly practical lumberman to operate a valuable timber property in Eastern Canada. The property comprises an area of 70,000 acres of first-class timber land, with good drivable streams, well improved, all through the lands, making hauling short. The cost of cutting, hauling and driving to the mill is comparatively low. 75 per cent. Spruce, 25 per cent. Hardwood. First-class mill, with capacity of 12,000,000 per year. In good repair. Joseph Bureau, of St. Raymond, Que., estimates 210,000,000 feet (B.M.) merchantable timber, and 490,000 cords pulp wood. Owner has not capital to develop this fine property, which has exceptionally favorable location for transport entirely by water, and desires the co-operation of a thoroughly practical lumberman who can take up the operation and provide the necessary capital for its development. Owner would suggest that all capital necessary for development should be secured on the basis of 6 per cent. First Mortgage Bonds, and no money is required for any other purpose than to operate the property. The owner will be glad to hear from anyone interested in this proposition. Address Box 837, Canada Lumberman, 15 Toronto, Ont.

For Sale

Long Lumber mill with store and new house for manager, several workmen's houses, barns, etc., with five hundred acres of freehold lands, located on Metapedia River and I. C. Ry., right in the heart of a good timber country. Will sell very cheap in order to close up an estate. Box 834, Canada Lumberman, Toronto, Ont. 14-17

Virgin Timber Limit For Sale

Ninety-one square miles of virgin growth of spruce, pine and cedar, at least three hundred million feet B.M. Property is well watered for getting out the timber, and located so as to make foreign water shipments if desired. Terms can be arranged to suit purchaser. Box 835, Canada Lumberman, Toronto, Ont. 14-17

Timber Limit For Sale

Timber limit in British Columbia containing 138 million feet of merchantable timber. Situated on lake. Timber can be logged to water for between \$4.50 and \$5.50 per M. Will sell all or part on arbitration cruise. Price 75c Per M. on terms will include all hauling machinery already on limits. Reply to Box 839, Canada Lumberman, Toronto, Ont. 15-16

Timber Limit For Sale

Timber limit, including Coal Rights, containing 16 M. feet of Yellow Fir, Cedar, Spruce and White Pine. Situated on Vancouver Island. 12 miles of railroad, locomotives, donkey engines, and complete hauling and logging equipment. Timber under Crown Grant with no royalty. Three million feet of logs in the boom. Accessible situation, favorable logging conditions. Maps, photographs, and cruisers report ready for inspection. Reply to Box 840, Canada Lumberman, Toronto, Ont. 15-16

WANTED

By reliable and experienced logger, contract to take out two million feet of logs or more yearly in good timber. Prefer to start in September. Please state location, average size of logs and full particulars to Box 844, Canada Lumberman, Toronto, Ont. 15

Sawmill For Sale

On Georgian Bay, near Little Current, close to north shore; practically new, well built and equipped with shingle machinery; over one mile of water front, loading dock and sheltered booming ground; plenty of timber available locally or can be rafted in from north shore or Georgian Bay. Good opening for retail store in connection. This is a splendid chance for millman with small capital; price right. Good reason for selling. Great Lakes Lumber Co., Ltd., Owen Sound, Ont. 5-T.F.

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont.

**Tenders for Pulpwood Limit**

Tenders will be received by the undersigned up to and including Friday, the 15th day of August next, for the right to cut pulpwood on a certain area tributary to the Lake of the Woods, in the District of Kenora.

Tenderers shall state the amount they are prepared to pay as bonus in addition to dues of .40c. per cord for spruce, and .20c. per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill on or near the area referred to.

Such tenders shall be required to erect a mill or mills on or near the territory, or in such place as shall be approved by the Lieutenant-Governor in Council, and to manufacture the wood into paper in the Dominion of Canada.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario for ten per cent. of the amount of their tender; to be forfeited in the event of their not entering into an agreement to carry out conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. Hearst,

Minister of Lands, Forests and Mines.

Toronto, Ontario,
May 20th, 1913.

12-15

Miscellaneous**Manufactures Wanted by Town**

Of Blind River. Situated on the Georgian Bay, eighty miles east of Sault Ste. Marie, Ont. Canadian Pacific Railway runs through center of town and within stone's throw of harbor. Abundance of hardwood, spruce, cedar and hemlock within close proximity.

The town is supplied with abundance of electric power from the plant of Mr. F. Deagle, situated at White Falls, near by, and if necessary a great deal more could be generated.

The town has suitable mill site which it is prepared to lease on easy terms to responsible parties, for manufacturing purposes.

For particulars apply to M. F. DYKE, Town Clerk, or F. Y. W. BRATHWAITE, Secretary Board of Trade, Blind River, Ontario, Canada. 14-15-16-17

Timber Limit For Sale

Timber Limit in Province of Alberta, tributary to Saskatchewan River; small area; conveniently situated. Estimate, recent cruise, about eighty million feet, spruce and pine. For price and full particulars, apply Box 820, Canada Lumberman, Toronto, Ont. 13-16

Coast Lumber in the East

From various sources come hints that the lumber business is getting ready for the Panama Canal. The general opinion seems to be that the way to handle West Coast products in the East after the opening of the canal is to ship to manufacturing plants on the eastern seaboard which shall be operated in connection with distributing yards, says the American Lumberman. Such projects are already under way in Philadelphia, and perhaps elsewhere, while a number of West Coast people are studying the matter with diligence. Over a year ago these investigations of

the matter began. At that time the lack of vessels suitable for the lumber business through the canal somewhat curbed enthusiasm; but vessels are being built in some numbers and while at the opening of the canal there will probably be a shortage of tonnage that matter will be remedied as fast, perhaps, as the trade demands it. Those who expect that Pacific coast woods are going to jump into the eastern markets at the rate of hundreds of millions of feet a year at the start will be disappointed, but there is room, and there will be increasing room as the years go on, for West Coast lumber, and those who will make money out of the business are those who most carefully study the situation and make most careful preparations for the trade that is to come.

Waste in the Veneer Room

A great deal of valuable veneer is destroyed and thrown out as refuse in the veneer room, as the result of careless or improper cutting. The average chopper spoils a great deal of veneer. By careful attention to this work the vigilant manufacturer can reduce the cost of his veneer bills very materially. The chopper who turns out five baskets of refuse of which three might have been saved is too expensive a man to keep in one's employ a single day.

Chestnut in Door Work

We are led to think, in this day of rapid transit and continual intermingling and intercommunicating, that provincialism is largely a thing of the past and every part of the country knows in every detail all the time what every other part of the country is doing. Moreover, we intermingle our wood products in what seems like a pretty thorough manner, shipping birch into the South and oak from the South into the North, redwood and California pine into the East, and hardwoods to the West, but just the same there is more or less provincialism both in the manufacture and use of doors, says an American writer. There is quite a section of the East, for example, in which the solid chestnut is an important item, while in other sections of the country a chestnut door would be something of an oddity. In other words, there are doors such as birch and oak in the hardwood line that are familiar the country over, and even the chestnut door may be met with now and then in every section of the country; but there is an eastern territory in which the chestnut door is about as familiar an article as the birch door in the North and the yellow pine door in the South. This territory takes in part of Pennsylvania and part of New York and Virginia, and practically covers the section in which chestnut has long been an im-

portant wood in furniture and other cabinet work.

In former years good chestnut was more plentiful than it is now and consequently not so high in price. It was easy to get higher grade material for door making and as a result the chestnut was among the first of the hardwood doors to become popular. The solid chestnut door is still holding a favorite place in quite a section, but it is no longer so easy as it once was to get high-grade material at low cost for making it. The result is that in the making of solid chestnut doors today it is quite a practice to buy sound wormy wood, using the best cutting from it to make solid doors, and the balance—that which has too many worm holes for face work—for cores in the making of veneered doors. Chestnut is one of the admittedly best core woods going, and the worm holes in it help rather than hinder its usefulness in this work. Therefore sound wormy chestnut is a very desirable product for making up the core bodies of veneered doors. The veneered door is a familiar article everywhere and is used to quite an extent in every community in the country; consequently the combination works out well for the door business and makes chestnut quite an important item to the makers of doors in certain sections of the country.

Durability of Wood

Place a piece of any durable wood, a piece of iron and a piece of marble in some fairly dry place protected from sun and rain, but exposed to air in circulation, and which will last the longest? The wood will remain sound after the iron has become a heap of rust, and the marble a shapeless mass of carbonate of lime. If, however, the wood becomes sufficiently damp that fungous growth can attack it, its life will be much shorter than the other two materials. We think of stone as imperishable, but hard water is merely water in which rocks have been dissolved by the carbonic acid gas of the atmosphere.

Strength of Dressed Chestnut Lumber

The spread of chestnut blight has resulted in the manufacture of considerable chestnut lumber from affected trees and sometimes difficulties are offered as to the quality of such lumber. In a recent press bulletin the Forest Service states that strength tests indicate that sound wood from chestnut trees affected by the bark disease is as strong as the green timber. The disease affects the trunk only and does not kill the wood, but about two years after the death of the tree fungi and insects attack it and injure the wood. There is a good demand for all chestnut products except cordwood, which does not

sell readily except when within shipping distance of extract plants, brass foundries, lime kilns, brick yards and charcoal plants. The Forest Service further recommends that in shipments of chestnut affected the bark should be removed, which would prevent spread of the disease.

Tighten Your Bolts

Just because a little effort is required to tighten the bolts in Berlin round cylinders, I find that some of our more careless operators even go so far as not to use a wrench at all in fastening these bolts.

It is quite unreasonable to expect knives to be held firmly in any kind of a cutter head, travel-in gat a terrific speed, unless a reasonable amount of precaution is taken.

The knives of Berlin round heads will never move from their position if a small "T" wrench is used to tighten them as firmly as possible.

Caution your operator against this and it may prevent a possible delay or accident.

Muskoka Lakes

FOR RENT COTTAGES

If you want a real holiday, plan to spend your vacation, this year in Muskoka where "the breezy call of incense breathing mom" will put new life in mind and body. Muskoka offers more real healthful enjoyment for less money than any other resort in the world.

Four cottages to rent \$125 to \$200 on Bohemia Island, less than a mile from Royal Muskoka Hotel and good Golf Links. Box 771,

Review of Current Trade Conditions

Ontario

In spite of the fact that a good many complaints are heard from the trade, general appearances would indicate that, although as much business as was done last year is not being done at the present time, conditions are very nearly normal. The holiday season being now in full swing, many lumber buyers are away from their offices and consequently very little buying is being done for future delivery. A very encouraging fact is that the manufacturers of flooring and also the box makers have plenty of orders on hand and are working full capacity to meet these orders. This is satisfactory in that it shows that there is plenty of building going on—and there is undoubtedly a need for many houses in the majority of the cities and towns of Ontario—also that the customers of the box makers, who embrace a very wide field, have quite a demand for boxes. It is also of interest to note that although wholesalers report that business is very slack at the moment there is very little, if any, reduction in the general price-list.

Hemlock, which for a considerable time past has been exceptionally high, in the last few weeks has shown a slight decrease in price, but there is no good reason to suppose that any appreciable drop may be expected for some time. Spruce, on the contrary, is still quite active and in view of the fact that the demand for desirable stocks seem to exceed the supply, prices have been well maintained.

The hardwood market is still firm and conditions would seem to indicate that prospects are bright for business in the very near future. Within the last week or two quite a demand has arisen for the various grades of birch and as there does not appear to be any over plus of stock, prices are likely to be well maintained for a considerable period.

At Ottawa the market seems to show that better conditions are likely to obtain in the very near future and that considerable improvement has been experienced within the last few weeks. It is, of course, perfectly natural that until a definite statement is received as to what changes will take place in the United States tariffs, trade with that country is liable to be uncertain.

Trade with Great Britain is still steady and some big orders have recently been placed for shipping squares.

Eastern Canada

Very little change has been apparent in Montreal since our last report. Owing to the monetary conditions at present obtaining, wholesalers are not very keen on getting out for business. There also appears to be a considerable slackness in building operations and until the financial conditions improve considerably, no great increase in trade may be expected. However, the general opinion seems to be that the demand should be sufficiently large to keep the prices firm. Trade from local yards has, however, been pretty steady during the last months and consequently the stocks in the retailers' yards are not very heavy as they have not been making their regular purchases during this period.

As in other provinces the trade with the United States has been particularly quiet owing to the uncertainty as to what tariff changes will be made. Exports to Great Britain have been fairly satisfactory taking condition of the market on the other side into consideration. The increase in the situation has, however, caused somewhat of a slump in the Canadian shipments and the fact that the lumber has been coming slowly into this part has not improved the situation.

Considerable improvement has, however, been shown in the ground woodwork, and a substantial increase in price has been noticed on recent shipments and a number of inquiries are coming in for further supplies.

Western Canada

Although very little improvement has been noticeable during the last few weeks and building operations have been, in a number of cases, suspended owing to lack of funds, the situation is by no means so gloomy as some pessimists would have us believe. In a number of towns where real estate has not been unduly boomed the sale of lumber has been quite satisfactory. There is unquestionably a genuine demand for lumber for building houses and the ever-increasing number of immigrants arriving in the West will stimulate this demand.

Some reports, which were shown to our representative by a gentleman who controls a number of retail yards in the Western Provinces, proved that more business had been done throughout their yards this year than last and also that the first six months of this year produced more business than during the similar period in the last three years.

At the coast, the drop of 50 cents in the price of graded fir logs which took place some time ago has not been altered. Shingle manufacturers report very favorable conditions and there is nothing at present to indicate that the demand will appreciably decline. The railway companies have under construction many new branch lines and, as is usually the case, many lumber yards may be expected to materialize along their routes.

Great Britain

Satisfaction is expressed with the condition of trade at London and prices are keeping up. Floorings particularly are very scarce, and prices consequently show no sign of getting lower. In fact this shortage is very marked, and doubt is expressed as to where the supply is coming from in the immediate future. June was a particularly busy month, and showed an increase of no less than 19,000 standards over the same month in 1912. In the same way the trade for the first six months of this year showed a gratifying increase over the same period of 1912.

Business has been slack at Liverpool owing to the holidays, or wakes, which are so popular in Lancashire. An interruption has also been caused by the visit of their Majesties the King and Queen to the various towns in this vicinity. This visit created quite a demand for spruce deals for erecting stands for spectators, but, of course this consumption is comparatively so small that it will not make any great alteration in the market. There is every indication, however, that spruce will command a high price in the near future, and the chief reason for this is that the strike in the mills at St. John, N.B., has considerably lessened the amount exported from there, and consequently those who are holding stocks will naturally be justified in obtaining as good a price as possible. The usual shipments from Montreal and Quebec are due to arrive shortly. The demand for hardwoods is still very brisk, and although larger quantities are arriving, they are easily disposed of. Altogether, the hardwood business appears to be in quite a fluctuating condition.

Two cargoes of spruce have recently arrived at Manchester from Miramichi and Campbellton, totalling together about 2,600 standards.

United States

The usual slackness which appears annually at this time is again in evidence, and the market may be expected to be quiet for a few weeks to come. Reports from Chicago indicate that consumers are still only buying for immediate requirements, and it is not expected that there will be much change in this situation before the Fall. The unsettled condition in the labor world is also no doubt to a large extent responsible for the present quiet times. In spite of this, however, lumber receipts of Chicago during the week ending July 12th showed a considerable increase over the same period of 1912. The situation in New York is also very quiet, and what business there is is being done at considerably lower rates than were obtained a few months ago. The yards are disposing of their stock, and do not seem inclined to buy anything ahead at present. There is a limited demand for Eastern spruce in New York, and there is plenty being offered at present. However, a number of inquiries are being made and prices are consequently being maintained. The demand for hardwoods is only moderate in Chicago at present, but it is anticipated that the furniture manufacturers will shortly be compelled to purchase new stocks. Similar conditions appear to obtain in New York. A fair trade is being done in Buffalo and the vicinity, and optimism is expressed as to the prospects for Fall business. There is quite a scarcity of stocks of oak, so that considerable stiffening in the prices may be expected. The hemlock trade is probably in a more assured position than any other lumber in Chicago, although trade is quiet at the moment. The heavy demand which was experienced last year has kept stock low and the mills have only a fair quantity on hand. In New York the hemlock is more in demand than any other lumber, and the yards are still buying in appreciable quantities, and thus the price is maintained. In Buffalo a big demand for hemlock is anticipated in the near future, and dealers are eagerly looking out for possible supplies, so that if anything, a stiffening of prices will be expected.

Better Outlook on the Prairies

W. Mark DeCew, lumber manufacturer, Grand Forks, B.C., reports that a strong demand for lumber is expected from the prairie provinces within the next two months. He bases his opinion upon information gathered during a recent visit to Calgary.

View of Mills in Sarnia.

Norway Silo Stock

We are headquarters for Norway Silo Stock in 2 x 6 and 2 x 8 any length up to 40 feet.

A stock of dry Norway and White Pine lumber is always on hand ready for prompt shipment.

We also cut long timbers in any length up to 60 feet from Pine or B. C. Fir.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John News—Strike Still Curtails Trade

St. John, N.B., July 21st; (Special to the Canada Lumberman).—The market for long lumber at St. John is practically marking time with the exception of a little local trade. About all the deals at the different mills have been shipped and very little stock of any kind remains at the mills, in fact the yards were never cleared so well, stock which was old and discolored having been sold off at good prices to the carpenters and builders, who, pressed to get material, were willing to take anything and pay the prices.

The mills still remain idle and no signs of settlement are to be seen at present, but, as the work outside the mills is getting more scarce, the men are beginning to become more discontented and may return at any time. The mills manufacturing for the American market feel that this enforced idleness will not be detrimental, as practically no business at a profit can be had from their own market at this time, the bottom having apparently fallen out entirely during the last three weeks. However, as the yards are empty over there and the cut short on this side, it is felt that by the Fall prices must come back and business be much better. Furthermore, the English contractors for the deals from the provincial mills are not pushing for fulfillment of their contracts so it is to be hoped that this shut-down will work out in the end to the benefit of the manufacturers.

Prices for English goods remain the same, although it is said that business in Great Britain in deals has eased slightly, but as general trade never was better there and the cut of deals is short all over the province, it is felt that the market in the Fall will stiffen over this Spring's prices.

In the American market the chief difficulty is to dispose of the cargoes at all, the question of price being quite a secondary consideration, as buyers are very scarce at present. Yards are simply buying for their immediate requirements and as the short and long leaf pine mills of the South are putting their stock on the market for whatever price they can obtain, spruce for the moment is practically inactive. However, after these mills have unloaded and are thus able to settle their outstanding liabilities, the impression in the trade is that spruce will go higher.

Prices in New York are ranging from \$18 to \$24, according to the specifications, but there are more sales for random around \$20 than there are at \$24.

Laths are easing off and it seems hard to be able to sell above \$4.00 at New York.

All the woodworking factories at St. John report plenty of work, but they are greatly handicapped in supplying their orders as they cannot get lumber from the city mills, and the outside supply is limited. Since the strike came on the factories have advanced many of the staple articles from \$4 to \$5 per 1,000 feet, and are reaping a harvest.

All the logs of the St. John River Log Company are now in the booms and will be finished rafting in about four weeks; the output will be about sixty millions.

Vessels for coastwise freights are having a hard time to find cargoes because of the strike here and freights have weakened from \$4.25 to \$3.25 per 1,000 to New York.

Ottawa Trade News—Demand Still Moderate

Ottawa, Ont., July 22nd; (Special to the Canada Lumberman).—Early in the year lumbermen in the Ottawa Valley had high hopes that this summer would be a record breaker as far as the volume of trade was concerned, but they did not anticipate that there would be serious tampering with the United States tariff, nor did they have any inkling that there would be a pronounced tightness of money, both of which causes have had a bad effect on local trade. The latest reports, gathered from some of the most prominent lumbermen in this district, are that though business is none too brisk at present, the prospects for an improvement are bright.

Until the tariff changes are definitely settled there is not likely to be much lumber exported to the United States. The demand from the English market is fairly good and there have been some big orders placed here recently by British firms for shipping squares.

Some inconvenience is being felt by lumbermen along the Ottawa river owing to the water there being at an exceptionally low point just now. At the foot of the Rideau Canal locks it recently measured 8 feet 9 inches as against 11 feet 10 inches on the same date last year. The long absence of rain is given as the cause.

Leading lumbermen in this district report that they have had no

difficulty in obtaining help this year and one gentleman, prominent in the lumber world, stated that he had not received so many applications for work from men for ten years as he has this year. Many employers of labor stated that they are quite in accord with the circular which has recently been distributed throughout Canada and Great Britain by the Canadian Trade Association warning intending immigrants to be wary of coming to this country for employment without first ascertaining what the exact labor conditions are in the province to which they propose to come.

Shepard & Morse intend sending more men into their camps at Kippewa this year than ever before. The advance guard will leave Ottawa about August 1st. The firm expects to employ about 500 men in their camps this year and make a bigger cut than last season.

R. R. Williams, formerly treasurer and travelling salesman for the McAuliffe Davis Lumber Company, has gone into partnership with his father, and will trade under the name of the Williams Lumber Company, as formerly.

Montreal Market News—Trade Conditions Unchanged

Montreal, July 18th, (Special to the Canada Lumberman).—Comparatively little change has occurred since my last letter. Wholesale lumbermen report that trade has undoubtedly slackened, and that, owing to monetary tightness, there is an inclination for building to slacken. Collections are difficult, and in view of this, some wholesalers are restricting their operations. One lumberman, however, expressed the view that prices will not decline to any extent; and he based his opinion on the ground that lumber is likely to be scarce, and that the demand will be sufficiently large to keep values firm. Stocks in the retailers' yards are low, he stated, they having done a considerable trade during the past six months.

Firms transacting business with the United States say there is no improvement in the demand.

Dimension timber is in slow demand. Business has been fairly good this year, but as several big contracts are held up, the inquiries have fallen off.

Exports to Great Britain are fairly good, considering that the market on the other side is by no means satisfactory. The heavier freights have a tendency to curtail Canadian shipments, while the lumber, particularly pine, is not coming forward to this port at anything like the rate it should do.

The ground wood market is on the up grade, and a few days ago 1,000 tons were sold on contract at an advance of two dollars, the pulp being of a specially good quality. It would thus appear that prices are inclined to go higher, and inquiries are coming in more freely. One or two of the large mills have heavy stock on hand and one mill has just closed down several grinders. It is probable, however, that a better demand will set in, and that by the fall the accumulated stocks will have been absorbed.

There is little variation in the sulphite situation. The Canadian paper mills are fully employed. In this country there is a good demand for sulphite, while reports from Europe indicate a very strong market.

The following figures show the Canadian exports of chemical and ground wood pulp and news print from May of last year until April, 1913:—

May	\$170,843	\$226,698	\$285,400
June	154,753	195,134	280,891
July	146,440	252,043	385,038
August	147,899	363,455	370,462
September	158,484	518,607	397,061
October	192,017	401,567	500,550
November	178,032	331,625	631,227
December	201,410	402,751	567,284
January	182,576	159,371	515,072
February	188,736	131,429	579,186
March	227,731	284,692	920,126
April	202,110	143,126	594,554
Tota	\$2,151,031	\$3,410,498	\$6,026,941

Better Markets at Tonawanda

North Tonawanda, July 22nd, (Special to the Canada Lumberman):—After a period of several weeks' inactivity it is gratifying to note that leading lumbermen here report that business is at present better than normal and that there is consequently hope for even

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

better business when Congress has adjourned. The chief feature of the market is the unusual demand which is being experienced for the lower grades. The inquiries for these have been so persistent and so generally followed by orders that stock which has been held at upper lake ports is being rushed here to replenish the depleted stocks.

Another pleasing feature of the trade is that lumber tonnage is more plentiful on the Great Lakes than at any previous period since navigation opened. This is due to the fact that fewer cargoes are being offered to other points and the result is more boats for the service of the local dealers. On the other hand there is a decided scarcity of canal tonnage with the result that lumber consigned to ports between Tonawanda and the Atlantic seaboard is being held for want of boats to carry it. The reasons for this shortage is that many boats which formerly carried lumber are now carrying sand, gravel, and other material for the contractors who are enlarging the canal. The number of canal boats on the Erie Canal, since the enlargement to 1,000 ton capacity began this year, is far too small to satisfactorily meet the demand of the lumber dealers and canal builders.

Last year's cut was fairly well cleaned up at the upper lake ports and only a small quantity of the new cut has made its appearance as yet. A few local buyers have received some, but it is not expected that there will be very much for disposal for a week or so.

Two local lumbermen have recently been appointed to positions on the National Wholesale Lumber Dealers' Association, Mr. Maurice Preisch, of the Haines Lumber Company, taking a place on the board of managers, and Mr. W. H. Stradella, of the Northern Lumber Company, being on the membership committee.

A considerable quantity of cork white pine has recently been received by the R. T. Jones Lumber Company on Tonawanda Island. This stock is receiving a lot of attention as its scarcity a few years ago drove it out of the local market. This stock is arriving in from 2-in. to 6-in. thick and 20-in. to 40-in. wide.

Tonawanda will be the western terminus of the new canal, which will be four times as large as the present Erie Canal, and it is anticipated that work will be finished in time for the opening of navigation in 1915. The canal traffic from the Tonawandas this summer has been practically light, only 25,000,000 feet passing through the locks, half of which was unloaded at the docks of the Eastern Lumber Company, which has no river dockage. This would leave about 12,000,000 feet as the total shipped east by canal, a showing of about half the average for the last ten years.

Glasgow Trade Quarterly Report

Disappointing Volume of Business—Stagnation in Demand for Timber—Deal Stocks Low and Prices Firm

Calder, Henderson and Livingston, Glasgow, in their quarterly timber market report under date of July 2nd, say: The volume of business transacted during the quarter has been disappointing. There was an entire absence of anything approaching animation and the demand was slow. The weaker c.i.f. prices ruling for pitch pine had an unsettling effect and buyers lacked confidence in the stability of values in other woods, and this resulted in purchases being confined to the limit of absolute wants. Arrivals from Canada, although small, have been sufficient to meet all calls, and imports from other sources more than covered requirements. Stocks in the aggregate are ample at present.

Spot values of pitch pine fell in sympathy with the drop in c.i.f. quotations, but prices of other woods were on the whole steady. Steady orders emanated from the ship yards, but lately these have been curtailed on account of the prospect of a strike of the workmen. Once a compromise is reached a steady consumption of timber from this source may be looked for as the work on hand is plentiful.

The output of tonnage for the past six months, which constituted a record for the Clyde, was 348,475 tons, as compared with 289,586 tons for the corresponding period last year.

Packing-case makers are moderately employed, but joiners are quiet, and house building still remains in a dull state. Cabinet makers are reported to be busier than they have been for some time.

Canada—St. Lawrence—Yellow Pine—Waney—There has been no import. Stagnation characterized the demand for this commodity during the past six months, and the consumption has been very disappointing. The stock is principally 1st class deckwood, held chiefly on merchants' account, and is excessive. The shipyards are the principal operators in deckwood, but the high level which prices have reached has caused them to use cheaper substitutes, amongst others Oregon pine, large quantities of which in cut sizes were contracted for, so that the outlook for yellow pine deckwood is at the moment none of the brightest. Quotations are nominal. A small transaction in 2nd. quality is reported at a poor figure. Square—There were no enquiries. Stocks are exhausted.

Elm—The demand has been disappointing and the consumption below the average, the high figures wanted tending to check purchas-

ing beyond actual wants. Stocks are too heavy considering the present position and are composed principally of Prime quality wood, and are largely in merchants' hands.

Oak logs—A steady movement has taken place into consumption and the stock is very light, and is held by consumers. Values are high with an upward trend.

Birch—Logs—Arrivals were extremely heavy, the bulk being round logs on contract to a large local consumer. Of hewn logs only a moderate quantity came forward, and these were for the most part against contract. Consigned parcels sold readily at from 23d. to 2s. per cubic foot for 14 to 15 in. average. Stocks of hewn are light, but a fair sized parcel is reported now on passage. Planks—Supplies were light, and met with a ready sale around £14 5s. per St. Petersburg Standard ex quay. Values are inclined to be firmer.

Deals, Battens and Boards—Supplies of deals and sidings during the quarter have been light, and the demand has been much below what was expected at this season of the year. Deal stocks are low, but that of sidings is ample for present wants. Values of deals are firm but sidings are weak. Pine—Firsts—Only broad deals were imported, but enquiries were not numerous. The high figures required restricted sales, and values were difficult to maintain in competition with sugar pine. The stock while low is ample at present. No transactions took place in regulars and undersizes as there was no stock to offer. Some movement took place in good pine sidings, but the figures realized were inadequate. Seconds—Arrivals were light, regulars and undersizes were in best request and sold well at full figures. Thirds—Broad and undersizes were dull, but regulars were in demand and the small import went direct into consumption at firm rates.

Red pine—Owing to the quietness prevailing in the house building section there has been little or no demand. Some thick deals, principally 4-inch were imported during the quarter and were disposed of at a fair price considering the position.

Spruce—With buyers failing to respond to the high figures required, supplies entirely ceased during the quarter. Transactions were confined to the small stock in merchants' hands, and values were strictly retail. The stock is now very low, and buyers are filling their requirements from the Baltic.

Nova Scotia and New Brunswick:—Birch—Logs—Arrivals were moderate and were readily disposed of at firm values. The demand, however, is not active and stock on hand is ample at present. Planks—Have been sparingly imported and chiefly on contract. Values are firm.

Pine—There have been few enquiries and the stock is ample.

Spruce—The import during the quarter was fairly heavy, the bulk going direct into consumption to a large local consumer. Otherwise the demand has been quiet, and values in competition with Riga goods have not reached the equivalent of current c.i.f. quotations. Stocks are low and consist for the most part of scantling sizes.

Liverpool and Manchester Stocks

The following tables showing the quantity of stocks, etc., at Liverpool on July 1st is furnished by H. W. Lightburne & Company, Liverpool, Eng., through their St. John, N.B., representatives John E. Moore and Company, Limited.

Utilization of Hardwood Waste

By R. B. Goodman

First of all I desire to call your attention to the fact that in speaking of hardwood waste we do not mean an economic waste at all, but simply despoiled or leftover material. If the producing of something valuable out of this material can be done at a profit it should be saved, but it must be remembered that the waste material is something tangible and evident to the senses, whereas the labor that may be expended in rendering this waste material valuable is often illusive and intangible and unless the operation has an accurate system of accounting, the efforts to save waste material may easily cause a greater waste of labor.

The problem of utilizing waste material is largely a problem of more efficient processes of labor and results are often so misleading that we all of us find ourselves occasionally handling waste material in one way or another at an actual loss. The amount of waste material, however, accruing from the manufacture of hardwood lumber is so great that we all feel the necessity of making some effort towards its utilization.

This waste material takes place: First—in the woods; second—at the mill; third—at the place the lumber is consumed.

I shall discuss only the first two of these sources. The waste in the woods is the greatest in bulk. Our specifications for logging birch and maple are 8-inch surface clear for birch, and 10-inch surface clear for maple. Since we adopted these specifications the value of birch and maple has increased over \$5 per M and it occurred to me that this advance would enable me to cut my logs on a much harder specification both as to size and character of the log.

We made interesting experiments in this line. We reduced our specifications to 7-inch and up for birch and 8-inch and up for maple and included a fairly hard grade or No. 2 log. This difference in the specification increased the cost of logging from \$1 to \$2 per M. The smaller and rougher logs decreased our cut at the mill some 20 per cent. with a consequent increase in cost of sawing of that amount. The larger percentage of low grade lumber decreases the average value of the product of the log, so that by endeavoring to utilize the poorer logs in our forests and thus to decrease the waste of material in the woods, we virtually increase the cost of our lumber more than \$5 per M and if we had had any means of determining the actual cost of manufacturing the poorer logs into lumber, it would probably have amounted to four or five times the value of the product obtained, so we have come to the conclusion that with our stand of timber 8 and 10-inch surface clear limits for logging birch and maple are the limits of economy. These specifications take not more than 30 to 35 per cent of the weight of the wood from the land, or 65 to 70 per cent of the weight of the material in our forests is left on the ground as having no economic value.

The second source of waste material is at the mill. Saw kerf, slabs, edgings and trimmings. The modern band saws have reduced the waste of saw kerf to less than half of what it was with the circular saw—in other words, it has been reduced from twenty per cent. to around eight per cent. If any one is sawing lumber with a circular saw, he can save the price of a band mill in saw kerf in a year's sawing.

More careful sawing or the use of slab resaw has reduced the waste of material from slabs, and careful attention to edging and trimming, the use of odd lengths in lumber, the crowding of wane and bark into low grade crating and box lumber has still further reduced the amount of waste in sawing up the log.

In hemlock, basswood and elm, a percentage of the waste of slabs and edgings is utilized for lath and squares, but when all these things are taken into consideration, there is still over a cord of refuse to a thousand feet of lumber. Approximately two-thirds of this goes into fuel as sawdust and hog feed, and one-third is available for other uses—that is to say, that approximately fifty per cent. of the weight of the merchantable log goes into lumber, thirty per cent. into fuel and twenty per cent. into wood available for other uses.

If these percentages of waste are approximately correct, you will see that the lumber produced from the hardwood forest is fifteen per cent. of the weight of the standing timber and that this is under the most improved modern conditions of manufacture. If the birch and maple yields sixty per cent. merchantable lumber against forty per cent. No. 3 the merchantable lumber would be approximately nine per cent. of the weight of the material in the standing forests.

Solutions of Problem are Numerous

The utilization of this waste material so that we obtain a value from it in excess of the labor expended on it, is a problem with as many different solutions as there are different hardwood operations.

If the mill is located at a remote distance from the timber and freight is paid on the logs, it is obvious that the possibility of bringing in a greater proportion of weight of material from the standing timber is largely reduced. Mills that are located at a remote distance from the timber are usually in large towns or cities and the waste material at the mill is more available for sale as fuel than for any other purpose. When the mill is located in the heart of the timber, as our mill at Goodman, we have found that after selling a small amount of our mill waste for local consumption as fuel, we have reached the end of our resources for the best prices that we have been able to obtain in the larger cities for short wood has not compensated us for the actual cost of handling same from the mill to the car, and while we have offered for the past four years, and are still offering to finance any reasonable proposition submitted to us for the manufacturing of our refuse into any of the numerous articles of commerce made from small pieces of wood—all the way from dowel pins to pail handles. All the propositions that have come to us, however, have been impracticable. The cost of labor involved precluding any possibility of profit, and while there are many specialties in hardwood, such as broom handles, special material for the manufacture of furniture, agricultural implements, ten pins, billiard cues, etc., nearly all of these specialties require not the refuse material but the pick of the logs.

We have tried to solve the problem of utilizing a larger proportion of waste material in the woods and practically all of the waste at the mill in birch and maple by erecting a chemical plant at Goodman for destructive distillation. This plant is of the oven type. Plants for the destructive distillation of hardwood in this country are of three types: the small retort plant, in which the wood is packed in small retorts and then charred; kiln plants, in which the wood is charred partly by its own combustion; and oven plants, in which the wood is loaded on iron buggies and chowed into large iron retorts or ovens. Our plant has six of these large retorts, each holding eight cords of wood at a charge, or a daily capacity of charring forty-eight cords of hardwood. This plant with its adjacent woodyards, system of track and the installation of boilers and pumps for supplying steam and water, cost approximately \$200,000, and the preparing of chemical wood and other requirements of operation require a working capital of \$25,000. The returns from this plant, however, after a fair deduction for depreciation, show a profit of between six and eight per cent. and the prices at which we are supplying this plant with hardwood leave a margin of profit of approximately \$1 per cord—as the compensation, however, allotted to the production of the wood fluctuates with the market value of the chemicals produced and as the market value of the chemicals produced, and as the chemicals are all now at a high value, we do not figure more than a return of 50c per cord for stumpage over a long period of years.

The requirements of wood for the retorts is very exacting. Only the heaviest slabs and edgings can be used and it is impossible to use wood containing excessive doze or streaks of rot; the wood must be split so that it does not exceed 6 inches in thickness or 12 inches in width; the wood must be all hardwood and seasoned for one year before it is ready for use. We have found serious difficulty in getting out this wood by the old method of wood choppers working in the timber. These difficulties are: scarcity of expert labor and its inferior quality, the necessity of constant and rigid inspection of the wood and after the wood is out; the risk of fire during the year it has to stay in pile for seasoning. The labor required to haul this wood and load on cars is as great as the original chopping and to these items of risk and expense, we add the necessity of leaving in our logging spurs for a year longer than would be required for logging only—consequently requiring a double amount of steel for this purpose.

On account of these objections we early came to the conclusion that it would be cheaper to manufacture the chemical wood at the mill. We cut the chemical wood in log lengths, i.e., we log the land clean, leaving only saplings under 5-inch, dozey trees and tree tops. We bring this chemical wood to our mill with our merchantable logs, sorting at the mill and running the rough and small logs to the wood mill where they are butted to 50-inch and run through split saws to be cut into sizes complying with retort wood specifications. The heavy slabs and edgings are conveyed so as to mix with the output of the wood mill and the wood is piled on cars at the mill, and taken to the chemical wood yard, where it is piled to dry and season.

This process being mixed with our regular operation is obviously one in which it is difficult to determine actual unit cost, but we believe that this method is cheaper and certainly more reliable than chopping in the woods, and it enables us to utilize wood that the

choppers are unable to split by hand. The wood mill, however, is an additional investment.

The operation of a retort chemical plant while comparatively simple, requires a few highly skilled men and great care in the regulation of its operation. Our plant has an installation of one 1,500 gal. pump for pumping water for the condensing vapour, and five 150 h.p. boilers for supplying steam for distillation. A switch engine is required for shifting the wood cars and pulling the retort buggies. The labor required for all departments aggregate ninety men.

Products of the plant are approximately as follows: Per cord of wood, 50 bushels charcoal, 11 gallons of 82 per cent. crude alcohol and 160 lbs. of acetate of lime. These products, with the exception of charcoal, are easily marketable under normal market conditions. The difficulty with the charcoal is that the domestic market within shipping radius of our northern hardwood operations, is so narrow that it is impossible to depend upon it and our chief wholesale use of charcoal is in the manufacture of charcoal iron. Owing to its low value and great bulk and its tendency to spontaneous combustion it is impracticable to ship charcoal in bulk for any great distance by rail, so that the second step in the process of utilizing chemical wood is the erection of a blast furnace unless there is already one near enough to the operation to contract for its output. The other products: alcohol and acetate of lime, while being capable of shipment for long distances and even available for export, are chemicals for which there is not a very large demand for in the arts. Wood alcohol has to compete with the more cheaply manufactured and more widely denatured grain alcohol, and only a slight stimulation to the production of acetate immediately reduces its price. In the course of the past five years the total value of the charcoal, alcohol and acetate produced from a cord of wood has fluctuated from \$6 with practically no demand, up to a total of \$11. Our costs per cord carbonized are about \$8.50. As the weight of a cord of wood is approximately equal to a thousand feet of lumber, and we are obtaining a cord of wood for each thousand feet of lumber manufactured, it would be seen that we are utilizing twice as much of the material in our hardwood forests, as we were in the manufacture of lumber alone. Our own plant is the minimum in size that it is practical to operate and plants twice or three times its size are better suited to economy of operation. It would follow, therefore, that the requirements for even the smallest chemical plant are as follows: First, a mill located near the timber, the available hardwood timber to be at least twenty years' supply, at the rate of

ten million feet of hardwood per year; second, sufficient supply of running water; third, proximity of charcoal iron furnace.

Qualities of Water-Soaked Wood

While it has long been recognized that soaking wood had some effect upon it, no careful study of the matter has been made in this country. In a general way it is known that prolonged soaking results in leaching out certain substances, thereby making it lighter, somewhat more resistant to decay, easier to season, and reducing the tendency of the manufactured lumber to shrink and swell. In olden times leaching with water was much practised by joiners. In Japan it is a common custom to store timber in water, and although this is done to protect the wood from rot, it is an interesting fact that Japanese wood manufacturers excel in the absence of the unfortunate "working" and checking.

In order to determine just what influence soaking has on timber, a very extensive series of experiments through many years was recently completed at the Austrian experiment station. Wood from eighty-eight trees, representing nine different species, was used, one-half cut in summer the other in winter. Specimens were tested after treating in four different ways, namely, (1) unsoaked, (2) soaked in standing fresh water, (3) soaked in running fresh water, (4) soaked in salt water. The soaking extended over periods of from one and one-half to three and three-quarter years.

One general conclusion reached was that soaking the wood in fresh water, such as occurs in the process of rafting logs, or from lying in mill ponds, or where wood becomes frequently wet from showers, and in similar ways, exerts a favorable influence on the wood by decreasing the hygroscopicity and thereby decreasing the shrinking and swelling. The danger of checking is lessened as well. A favorable influence also is probably exerted on the durability of the wood, though this could only be assumed. It would require several years more to demonstrate the accuracy of this conclusion.

Soaking in salt water appeared to lessen the shrinkage as compared to that of unsoaked wood. Owing, however, to the absorption of salt, which has a strong affinity for moisture, the hygroscopicity is increased, thereby causing a greater degree of swelling and warping when the wood is exposed to variable humidities. The checking was lessened by the treatment, and the compression strength is also less than that of wood in the air-dry condition.

EDGINGS

Ontario

The Ontario Paper Company will start one machine on August 1. It is the largest newsprint machine in the world.

The Riordon Paper & Pulp Company have started their sulphite mill at Merriton, Ont., it having been closed down since the 1st of March.

The Globe Casket Company, London, Ont., is considering the purchase of woodworking equipment. Jno. Ferguson is president of the company.

Wood Mosaic Company, Inc., New Albany, Ind., will establish a Canadian branch at Stratford, Ont. Have secured site embracing five acres and propose to erect a plant thereon costing about \$100,000.

Ottawa has obtained another lumber manufacturing plant, L. MacLean, of Montreal, who runs a flooring and roofing manufacturing plant in that city, has decided to establish a branch there in the old Warnock mill, Ottawa being chosen on account of its shipping facilities.

A large Cleveland, Ohio, firm owning and operating extensive American plants for creosoting railway ties recently wrote to the city of London, Ont., to ascertain whether a site suitable for the establishment of a Canadian plant could be secured in that vicinity. The company report that they may locate there.

Plans are progressing favorably for the merging of the interests of the Spanish River Pulp & Paper Company, the Lake Superior Paper Company, and the Ontario Pulp & Paper Company. The merger has been approved by the directors of the Spanish River Pulp & Paper Company and a by-law has been submitted to the shareholders.

The Andrew Lumber Company, Limited, has been incorporated, with a capital of \$150,000, to carry on business as timber merchants, saw millers, dealers in timber and wood products of all kinds, with head office at Sault Ste. Marie, Ont. The provisional directors are H. R. Andrews, J. R. Andrews, lumber merchants, and I. C. Jennings, attorney, all of Escanaba, Michigan.

Although the midsummer months are usually accompanied by low shipments of pulpwood out of Northern Ontario, owing to the difficulty in handling the wood through the bush in the north when snow is absent, the June shipments amounted to 1,071 cords. Earlton and Cochrane produced the largest amount among the towns, the former shipping 327 cords and the latter 148. Iroquois Falls shipments were but 14 cords, which would indicate that the product in that vicinity is being held for the completion of the pulp mills to be built there.

In order to forestall the destructive borers and prevent the loss of valuable material the Ontario Department of Lands, Forests and Mines has decided to sell the timber on certain lands burned over by the recent forest fires. Tenders will be received until August 26 for the timber on lots 9, 10, 11 and 12 in the second concession of the Township of Dana. For timber on berth G71, north of Rainy River, tenders will be received until August 19. A sale of the timber will also be held. It is located on berth G7, on Jackfish Lake, north of Rainy Lake, where the pine has been cut. Tenders will be received until August 6.

Eastern Canada

Lumber shipments from Campbellton N.B., this year will, it is expected, far exceed those of former years.

Mr. Charles E. Read, secretary-treasurer of the Riordon Pulp and Paper Company, Montreal, has just returned from a business trip to England.

The town council of Greenfield Park near Montreal are contemplating the purchase of 200,000 feet of lumber to complete their sidewalks. The secretary of the council is Mr. F. W. Humphrey.

The Degrasse Paper Company, in conjunction with the New York World, have purchased from Mr. D. H. Pennington, of Quebec, his pulpwood limits at Murray Bay, comprising 52,000 acres. The price paid was \$400,000.

A forestry survey of the lumber lands of the estate of the late John Gibson on the Nashwaak will be made this summer by a party under the direction of Eug. A. FitzRandolph, of Randolph, N.B. The party is now in the field.

Over 5,000 acres of crown timber lands were burned over in the neighborhood of Cedar Brook, N.B., early in July and a lumber camp owned by Mr. J. D. McLaughlin, of Red Rapids, containing about \$3,000 worth of supplies, was destroyed.

M. P. and J. T. Davis, of Ottawa, have been awarded the contract for constructing at St. Joseph de Levis, Que., the largest dry dock on the continent. The price is \$2,721,116. The dock will be 1,200 feet long to accommodate the largest vessels, and an immense quantity of timber will be used in its construction.

According to the estimate of one of the leading St. John, N.B., lumbermen, there are 60,000,000 feet of logs at present in the South Bay booms. The cause of the collection of so many logs being in the booms is the prolonged mill strike. For every thousand feet of logs in the booms the owners have to pay ten cents, and for the removal of the same to the mills they pay twenty cents.

The directors of the Laurentide Company held a meeting recently at which details regarding the new stock issue were finally settled. It was decided that \$2,400,000 of stock is to be issued to the present shareholders at par. As the outstanding issue is \$7,200,000, the shareholders will have a right to subscribe to one new share for every three shares held. Laurentide's authorized capital is \$10,000,000, so with the new issue, the outstanding capital will be raised to within \$400,000 of that amount.

The Miramichi Lumber Company and Foundations Limited, of Chatham, N.B., are having trouble over the conflict of their interests. Recently one of the lumber company's rafts fouled the construction company's works, carrying away a portion of them. The construction company then cut the raft clear and it went adrift. The lumber company now threaten a law suit and the con-

struction company claim that no one was in charge of the raft or it could have been saved and the damage prevented.

A dispute is on between the Gatineau Boom Company, which has charge of river driving on the Gatineau, and the city of Hull over the desire of the former to open the Gatineau toll bridge near Gatineau Point for purposes of navigation. The original lessee of the bridge recently had his right to collect tolls cancelled by a superior court judgment and now refuses to open the bridge. The boom company states it will itself take such action as is absolutely necessary if it is to carry on its operation, and threatens to hold the city responsible in case of any accident arising owing to the fact that no one is in charge of the bridge.

One of the largest contracts of its kind ever let and one which illustrates the growing use of scientific methods in modern lumbering, has been awarded by the MacLaren Lumber Company, of Buckingham, P.Q., to Vitale & Rotheray, forest engineers, of New York, for a complete cruise and report on the firm's limits along the Lievre River. A crew of forty cruisers will be engaged on the work and it will occupy at least a year and a half. The MacLaren Lumber Company own between 2,600 and 2,700 square miles along the Lievre. Mr. Rotheray will report not only on the amount of lumber but on its qualities of growth and the quantity of lumber which may be cut from year to year and still permit of reproduction. Mr. J. E. Rotheray, who will direct the work, is a graduate of Yale University and was a classmate of Mr. H. R. MacMillan, head of the British Columbia forestry service, and Mr. G. Piche, who holds a like position in the Province of Quebec.

Western Canada

The Vancouver Logging Company, Limited, has been incorporated in British Columbia, with a capital stock of \$25,000, and head office at Vancouver.

Forest fires occurred during the last two weeks of July in the country between Tete Jaune Cache and Jasper. The fire was some ten miles in length and approximately two miles wide.

Plans are in course of preparation for the organization in Alberta, probably with headquarters in Edmonton, of a retail lumbermen's association, similar to those of the United States and Eastern Canada.

The Canadian Panama Timber & Logging Company, Limited, has been incorporated in British Columbia, with head office at Victoria, and capital of \$100,000. The objects of the company include the carrying on of the business of timber merchants, sawmill proprietors, lumbermen, etc.

William E. Hawke, of Melfort, has been appointed first timber berth inspector for the Province of Saskatchewan. Mr. Hawke has been engaged in forestry work for the Dominion Government, and for many years past has been a resident of the northern portion of the province. He is thoroughly equipped for the undertaking of his new duties.

The Everett Pulp & Paper Company have secured an extra-provincial license to carry on business in the province of British Columbia, with head office for the province at Vancouver. Jno. H. Lawson, Jr., barrister, Vancouver, B.C., is attorney for the company. The company's capital is placed at \$672,000. The objects of the company are to manufacture all kinds of pulp and paper from wood, etc.

Logging operations in the coast district of British Columbia during the second quarter of the present year, according to reports received by the inspector, showed a cut of 240,000,000 feet of logs, as compared with 218,000,000 feet for the corresponding period of last year. A conservative estimate for the entire province would be about 325,000,000, a remarkable showing in view of the unsatisfactory state of the lumber trade.

Recent reports from Dawson tell of extensive forest fires along the upper Yukon and in places in northern British Columbia traversed by the Yukon telegraph line. Mr. Louis K. Schnoborn reports fires everywhere. The damage to forests in the Yukon last year by fires entailed the loss of millions of feet of splendid timber, and it seems similar losses will be sustained this season. The prolonged dry spell may be largely responsible.

The engineers of the provincial forestry department have commenced cruising the timber of the watersheds of the various creeks on the north shore of Burrard Inlet. When all information has been gathered it will be placed before the Vancouver water committee to help them in their work of conserving the water supply. This scheme involves the purchasing by the city of timber limits in the watershed of Seymour Creek for a number of miles from the present intake towards its source and the construction of a dam which will create a reservoir lake.

In order to facilitate the work of protecting the forests from fire, the British Columbia Government is building a number of trails through the danger areas to aid in concentrating the forest guards in an emergency. Work is going on at present on a trail from Gordon Pasha Lake to Powell Lake; a trail from Campbell Lake to Salmon River Valley, and a trail from Bond Sound to Kingcom Inlet. Cabins are being built along the trails at intervals to form resthouses for the fire wardens, and supplies are being packed in over the trails, in order to prepare for emergencies. The rainy summer which the coast district has had so far has prevented any forest fires from breaking out. The superintendent, Mr. George D. McKay, has a supplementary list of fire guards who will be set to work as soon as the weather gives any indication of proving conducive to forest fires.

Vancouver Lumber Company, Limited, Vancouver, B.C., report that on account of present conditions in the lumber trade they will not commence work at present upon equipping their cedar lumber and shingle mill at Roche Point. The cedar mill is practically complete as it stands although a few changes are to be made. It is a 24-ft. mill, equipped with a Clark 10-ft. band, 12 x 72 edger, 48-in. Wickes gang saw and pneumatic trimmers and slasher. The company also intends to put in a Merzhon re-saw 72-in., and two Curtis stackers and to re-build their kilns. They have three North Coast Kilns, 104 ft. long. They will also add two boilers to the steam plant. They intend to build a shingle mill equipped with 12 single upright machines. They have not yet decided upon the details in connection with these alterations. The company will cut about 20,000,000 feet of logs per year and make 100,000,000 shingles and 10,000,000 feet of lumber, practically all upper grades for siding and finishing. The plant will be operated and the output handled from the main office at Vancouver. The plant has about 1500 feet of deep water frontage and 20 acres of land. When it is complete the company will have invested about \$300,000 upon it.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,
December 20th, 1912.

The Machine Man's Best Friend— The Employer's Best Investment.

It is not a hard job to match cross-grained and knotty lumber, to manufacture all kinds of tough and fibrous material into merchantable products, when your mill is equipped with the proper Shimer Cutter Heads. The simplifying of the process is worked out in our factory and given to you in the make-ready we build into every Shimer Cutter Head.

The Shimer Limited, with Expansion, Fig. 628, Groove Head with 8 Bits and self-centering and spindle clamping features. Price \$36.23 each, complete.

The Shimer Limited in solid section, Fig. 625, Groove Head with 8 Bits and the self-centering and spindle clamping features. Price \$33.50 each, complete.

and the advertising features of the better product turned out.

Don't risk spoiling material which has cost you good, honest money. Get the Heads we recommend as best suited to feed of your machine and character of your work and we will take all the risks of your being pleased with the results.

Do it to-day !

We are anxious to prove these facts to you and invite you to investigate freely our claims that the Shimer Cutter Head is better and cheaper for Flooring, Ceiling, Siding, Ship Lap, Double Ceiling, or for Door and Sash mouldings than any other tool made for the purpose.

With the Shimer System of Cutter Heads in your mill there is no fitting up for Ship Lap, Double Ceiling or other change of work, a process that is always unprofitable. Simply slip on the spindles the Shimer Heads made for the purpose and the job will be a profitable one in the time and material saved

Fig. 203, Popular Expansion Groove Head with 4 bit seats, complete, net \$20.48. Made also with 6 and 8 Bits to each Head.

Address - SAMUEL J. SHIMER & SONS, Galt, Ont. Can.

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent than any other belt. They are made from skillfully selected hides with a stretch taken out of each section before it is made up in the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

14	16	171

by using our
**Patent Steel Band
Mill and Carriage**

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Actual Results That Are Convincing

Read what **FAY - EGAN** "LIGHTNING" **275's** are doing

HEAVY WORK IN LOUISIANA.

"We have dressed timbers as large as 6 x 8-inch on your No. 275 16-inch Matcher, and must say it has in every way met our approval. It gives us pleasure to recommend it.
H. E. BUCK LBR. Co., Lake Charles."

WORK THAT TESTS ANY MATCHER IN MICHIGAN.

"We use your No. 275 on a variety of work, running from $\frac{1}{4}$ to $1\frac{1}{2}$ -inch soft wood to $3\frac{5}{8}$ x $10\frac{1}{2}$ -inch oak and $4\frac{1}{2}$ x $6\frac{5}{8}$ -inch hickory. We plane all this stock on four sides, sometimes taking a $\frac{1}{2}$ -inch cut with the side heads on oak $3\frac{5}{8}$ -inch thick. A large part of our work is planing and matching circular tank staves $1\frac{1}{4}$ x 4-inch. Machine has greater capacity than our men. We are entirely satisfied.

ADVANCE THRESHER Co., Battle Creek."

FAST WORK ON ROOFERS IN NORTH CAROLINA.

"Actual book records show we put 8,100,630 feet of roofers averaging 1 x 7-inch through a No. 275 24-inch Matcher in 1911.

W. B. GETTYS LBR. Co., Zebulon."

A VARIETY OF WORK IN GEORGIA.

"We work all sorts of stock from $\frac{1}{2}$ -inch ceiling to sizing timbers 16 x 8-inch. In my 25 years' experience I have never seen its equal for the amount of work it will turn out. It has the most wonderful feed for its size and has not cost us a cent for repairs.

SHAW BROS. Co., Macon."

"Proof of the pudding is the eating"—these results can be verified or we'll send you circular and tell you where you can see a No. 275 in operation near you upon request.

Big Profits for YOU in J-M ASBESTOS ROOFING

The demand for a ready roofing that gives absolute fire protection is growing by leaps and bounds.

Hundreds of dealers in all parts of the country have taken advantage of this condition, and are building up a big business in J-M Asbestos Roofing.

This is the only all-mineral ready roofing on the market. Made of alternate layers of Asbestos felts and Trinidad Lake Asphalt. Literally a sheet of pliable stone. Contains nothing to rot, rust, crack or deteriorate.

Never requires coating, gravel or protection of any kind. Lower in first cost than tin or slate—and cheaper than all other roofings when cost per year is considered. Adapted to all types of buildings in any climate. Easy to apply.

There is a liberal profit for you in this roofing. Customers are quick to grasp its advantages. And one sale leads to many others.

Steam Press

THE American steam press is carefully designed and substantially built of steel. It is used for baling shavings, asbestos and many other materials.

The cylinder is 30" diameter by 45" high and the pressure maintained is from 60 to 100 lbs. according to the amount of material wanted in each bale.

Hog Knife

Disston Machine Knives

are noted for their
toughness and edge-holding
qualities

**Both vital requisites of a knife used
for heavy mill work.**

The Crucible Steel, which is the principal foundation for a good knife, is of our own manufacture—made especially for Machine Knives. Our long experience in making and studying steel has given us an insight into its manufacture for special purposes that enables us to produce at all times a steel that for the use for which it is intended cannot be equalled.

The hardening, tempering, grinding, etc., are all done according to exclusive Disston methods which produce the highest results attainable.

That these methods turn out Machine Knives which stand alone in their superiority is proven by the ever growing demand. Notwithstanding additions and enlargements made from year to year our Machine Knife Department is constantly working to capacity.

Send for interesting, illustrated booklet that tells the complete story.

UNTREATED

Without Cling-Surface.

or THIS?
or SLACK?
or 225° ARC?
or TREATED?

With Cling-Surface.

A Tight Untreated Belt.

A Cling-Surface Treated Belt.

The above diagrams, made directly from actual installation, speak volumes for Cling-Surface. Increased arc, higher pulling capacity for the belt, non-slip, decreased power loss, longer belt life, waterproofing, saving in lubrication oil, saving in babbitt and journals, saving

in labor and a great saving of worry are all obtainable where Cling-Surface is used on belt or rope drives, and only in this degree where it is used. Cling-Surface treatment makes a belt pull without making the belt surface sticky.

Send a trial order, or, at least, send for further proof, facts and figures. Let us quote f.o.b. Toronto.

WHAT you want is belting that will give you your money's worth in an absolutely dependable service.

It will take you about two minutes of your time to write our nearest house for straightforward facts that prove conclusively the unusual service of Leviathan Belting.

Main Belting Company

MONTREAL of Canada, Limited CANADA

Your Second Setting

Where will it be? Logically where there is a worthwhile supply of timber that can be bought at a fair price and the conversion of which will yield a fair profit.

By far the greatest number of these locations are

In The Great Out West

Others are making selections now. The most desirable tracts go first and are going rapidly. This is the year to get the best of what is left, even though you do not contemplate operating until the last log has passed through the mill you are now running.

We know there are more and better opportunities in the west than in any other section of the country.

Each year may find tracts of timber pass into the hands of operators and the range of choice becomes more restricted.

Plan to spend your vacation in the west and while out there take a look at some of the bargains we now are offering.

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

Four Inch Steam Set Works

Will increase the capacity of your mill

Because it lightens the work of your setter, making it possible for him to put through more logs every day.

Because quicker work is possible with it than with a hand operated machine.

Because it will set up to 4 inches with each throw of the lever instead of only 2 inches which is the limit of most hand operated set works.

These are some of the reasons why several operators have increased their cut over 2,000 feet per day. You can do as well.

Send for catalogue L-6.

KEEP YOUR EQUIPMENT GOING

inspection and tests. Each repair part must therefore go into place with the same degree of perfection as the original part. No machine shop is necessary. This is important when the locomotive operates at a distance from a repair shop.

Consider this when you purchase a locomotive.

YOU make money when you keep your equipment going. You'll earn most with equipment that will wear a long while and is easily and quickly repaired. This applies particularly to locomotives.

Our locomotives are designed and built for long life, hard work and quick repairs.

Extra parts are kept in stock for immediate shipment. These are made in jigs and to gauges carefully checked. Rigid adherence to standards of material are supplemented by strict

Waterous "Trouble-Proof" Haulup Chains

The efficiency of your haulup depends directly on the strength and the wearing qualities of your log chain. Waterous Chains have more than their share of both. They are built of selected materials. The shop work on them is of the very best. They are tested and inspected before shipment.

Next time you order chain—think of "Trouble Proof"—and specify "Waterous".

Waterous Forged Bull Chain

This chain is forged from the best refined wrought iron. It is 6 inch pitch and is built in seven sizes, ranging in weight from 2 1/2 lbs. to 15 lbs. per foot. Iron, steel and wood specials of various forms are supplied with this chain. It can be used on all size Bull Wheels and is also adapted for Rough Wood and Refuse Conveyors.

Short Link and Long Link Coil Chain

For strength and general usefulness this chain is hard to beat. Fifteen sizes are built ranging in weight from 150 lbs. to 2,335 lbs. per 100 feet. Only the best chain iron is used in its manufacture, welds are exceptionally long and carefully made, and all links are tested for size and uniformity before leaving the shops.

Waterous All Steel Haulup Chain

The heaviest, largest logs can be handled on this chain. It is the longest lived and cleanest chain we build. It is 8 inch pitch throughout and carries a heavy cast steel special spaced every 6 feet. Side bars, centre links and connecting pins are all of steel, the links and bars being drilled for the reception of the pins.

We also build Malleable Log Chain, Roller Haulup Chain, Chain for Pulpwood and for Saw Dust Conveyors.

Any length can be supplied.

Our list of Specials, Sprockets, Idlers and Spools is exceptionally complete. These are illustrated and described in our Chain Catalogue No. 108, which we will be glad to supply on request.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 16-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

Wilson's Hardwood Flooring

"The Standard of Excellence"

This illustration does not show you the largest factory in the world, but it does show you a plant that is unusually well equipped—where only experienced workmen are employed—where the highest grade materials are used—the home of

Wilson Bros. Limited, Flooring

The fact that we are one of the oldest and largest manufacturers of MAPLE FLOORING in Canada, should give you confidence to buy and recommend to your trade, not only WILSON BROS. LIMITED, MAPLE FLOORING, but also our BEECH, BIRCH and OAK FLOORING.

WILSON BROS. LIMITED on FLOORING means a carefully kiln-dried manufactured article. It is straightened, hollow-backed, bored, end matched, steel polished and bundled.

Besides our flooring we also specialize on VENEERED DOORS, and HARDWOOD INTERIOR FINISH to detail. Also Pine Doors, Sash and Pine Finish.

WILSON BROS. LIMITED, flooring and interior finish is generally recognized as the standard of quality and mill work, the kind that brings the contractor and the builder back to you with repeat orders.

The name WILSON BROS. LIMITED is stamped on the back of every piece of Flooring. This is a guarantee that it is properly manufactured and right in every respect.

Send us your business and you will be prosperous.

The W. M. Wilkin Gang

The design and construction is based on many years of practical Gang experience and with a thorough knowledge of the requirements.

These Gangs are strong and rigid machines, standing without vibration, when under labor, in all conditions.

The design makes this possible as all bearings are central thrust, free from side strain and are run without the use of water to keep cool.

With the double oscillation to Gang sash, constructed without a single troublesome connection; the maximum capacity reached in these machines; the ease with which they are kept up and operated, makes a Gang the most economical factor in the production of lumber, of any machine in use.

Built in all sizes in direct steam or belt drive.

Send for full description.

Saw and Lath Mill Machinery

"Dunbar" Clapboard Machine

Here is a machine that is indispensable to every lumber manufacturer. It will make clapboards out of lumber that cannot be profitably manufactured into anything else. It is guaranteed to take from 15% to 20% more out of the same lumber than the old style machine. Capacity from 5000 to 7000 per day according to quality of lumber.

Lath Mill

There is much waste in every mill that can easily be manufactured into lath by our improved lath mill, thus using up material that could not be utilized for any other purpose. This machine is inexpensive in construction, yet capable of turning out the very best work. Its capacity is 15,000 to 45,000 per day.

"Dunbar" Shingle Mill

This mill is acknowledged to be the most complete and satisfactory shingle mill on the market. It has a capacity of 15,000 and upwards per day according to the quality of the lumber.

Get our prices and particulars. It will save you money.

Standard Cylinder.

Double Deck Log Kicker, built with cylinders 8 inch to 18 inch bore and WITH BASE OR LOWER HEAD CAST SOLID TO CYLINDER.

We have many of these kickers in operation all of which are giving first class satisfaction. The Powell River Co., Limited, of Powell River, B.C., who have one of our 18 x 36 single kickers in operation have written us as follows:—

"Prior to installing this kicker we used an overhead log turner to pull the logs out of the trough. The kicker is not only working satisfactorily, but has enabled us to reduce our crew by two men."

Standard Steam Nigger

Built with 6" x 8", 8" x 10", 10" x 12", also 12" x 14" Cylinders.

We guarantee a positive steam cushion at each end of stroke. These Niggers are fitted with double ported balanced valves, absolutely guaranteed not to kick or stick. The valve cases are bolted to cylinders on "ground" joints, are perfectly steam tight, not requiring packing.

A Man with Over 40 Years' Experience

Mr. Erb, of the Genoa Bay Sawmill Co., British Columbia, who is operating one of our 10" x 12" Niggers says, it is the best Nigger he has ever seen. A man with his experience knows.

One of the many Unso-
lited Statements of
Users of Our
Feeds:

Burt's Corners, N.B.,
Jan. 14th, 1913.

The E. Long Mfg. Co.,
Orillia, Ontario.

"I want to say your steam feed
is an "Ideal." Some Millwrights
told me I would need another boiler
and it rather frightened me, but as
for steam, I never knew the
difference in it. It is just splendid.
Have used it ever since it was put in
and have not had a bit of trouble."

Yours truly,
(Sgd.) Elwood Burt

Direct Acting "Shot Gun" Feed, Fitted with Double Model "D" Valve

Built in sections to make up any required length, 8 in., 10 in., 11 in., 12 in., and 14 in. bore. WE POSITIVELY GUARANTEE THAT OUR VALVES WILL NOT STICK OR KICK. They are perfectly steam tight, and are without exception the most economical valves manufactured.

Below we give a partial list of our "Quality" Machinery. We build these machines for mills of any capacity.

Carriages	Feeds, Steam and Friction	Log Jacks	Log Turners
Cant Flippers	Lath Bolters	Log Kickers	Log Chains
Edgers	Lath Machines	Log Loaders	Rollers, live and dead

Saw Frames, Shingle Machinery, Trimmers and Transmission Machinery.

*Our Engineering Staff is
at your disposal.*

*Mill Plans and Specifi-
cations furnished.*

The Home of Long's "Quality" Machinery.

We are now fully organized in our new *fire-proof* factory, and are in a position to give prompt and efficient service. Our past reputation we are not ashamed of, but we are looking to our present "up-to-date" quality production to appeal to the practical mill man, rather than to any other source. In these progressive times no firm can hope to live on its past reputation regardless of how good it may have been. The present is what counts. For this reason we are daily expending money and brains to produce the latest idea of modern sawmill machinery.

Patented 1911

No. 152 Long Leg Seamless Heel, Draw String Moccasin

The latest improvement in Moccasins, doing away with all seams at heel. Under the old method the heel would come down and in a short time the wearer would be walking on it, wearing out the stitching, thus causing it to leak and rip. With the new process the heel will not flatten out, will always keep its shape, and there are no seams whatever making a clean smooth Ripless and Water-proof heel. Made only in the highest quality, all heights of leg, with or without soles or heels. Write for Catalogue and Price List.

Goodhue Belts

The Belting Problem Solved

THE most trying and severe belt service in any mill can be efficiently cared for by a Goodhue Belt. All your power all the time is efficiency.

Goodhue Belts are marketed in three brands, each made from the best quality leather, but for three different services.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taught.

"Acme Waterproof" belt is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

*When you buy a belt—buy a Goodhue.
Price and particulars on request.*

SNOW

FROST

Have no terrors for the Miner or Lumberman clad
in "Carss" Mackinaws---They keep out the cold.

The Best

In

Canada

The "CARSS" Pure Wool Mackinaw is the Only Genuine Waterproof Mackinaw made in Canada.

During the thirty years the "CARSS" Mackinaws have been on the market, their popularity has steadily increased.

"CARSS" Mackinaws are manufactured specially for the Lumber and Mining Trade, and are well suited to stand the hard wear to which they must be subjected.

The men who should know—Lumbermen who have to face the elements under the most trying conditions—unanimously agree that "CARSS" Mackinaws have no equal.

Conveyor and Power Belting

Made By the Oldest, Largest and Most
Perfectly Equipped Plant in Canada

Is Ready to Give You 100% In Service and Efficiency

Listen to the clang and whirl of one hundred ponderous machines in our belting plant—each doing its allotted part with infallible accuracy.

Watch the elaborate testing precautions the scrupulous attention to detail—the expertness of the operators and wide-awake alertness of the superintendents—from the time the fabric is first run through the frictioning machines until it emerges as a finished belt.

Note how little chance there is for human carelessness or inefficiency to mar the perfect work.

That's scientific belt making—factory pride in its products—reputation jealously guarded.

Our Method of Making Beltings That Endure

This is the way your belting will be made and your belting costs safeguarded—Whether your purchases be great or small. And forty years of belt making experience will be concentrated on your requirements—putting all the service that is humanly possible to embody in CONVEYOR or POWER BELTING, to give you perfect satisfaction.

No matter what conditions are we can make belting that will stand the strain. Our knowledge of climatic and working conditions insures this, while our methods of construction leave no possible room for doubting our ability to give you more in belting service than you have ever obtained before.

If the Belting You Buy Has Not Been Giving Service—
LET US DEMONSTRATE WHAT OUR BELTING WILL DO

Our nearest Branch will gladly give you any information you require

Water Proof **BEARDMORE** **Leather Belting** **Steam Proof**

Beardmore has given to the lumber industry a belt that withstands the severest tests of strain and endurance. Starting with the best hides obtainable, the tanning is all done under our own supervision at our Acton tannery and no matter what time is required or how much unfinished stock we are compelled to keep on hand, every hide is tanned right and therefore gives a good account of itself in the finished belt.

After tanning, this leather is then treated by our waterproofing process and herein lies the difference between "Beardmore" and other belting. This waterproofing process fills every pore of the leather and lubricates each of its tiny fibres—giving "Beardmore" a glove-like surface and pliability that insures the maximum of power transmission and minimum of strain on shaftings and bearings.

"Beardmore" is sold under a most liberal guarantee and if it fails to do as we say it will—your money will be returned. If interested, we want to send you our Book of Belting information—brim full of things about the care and use of belting that you ought to know.

Beardmore Belting Company, Limited
TORONTO - MONTREAL

These Belts Do Not Have To Make Promises They Have Made Good

Scandinavia

This belting has been making good for over thirty years on both main drives and direct drives. It does the work and gives good service year after year whether the drive be straight or crossed. The rubbing of a crossed drive cannot injure it. It has a good surface for clinging to the pulley, it runs true, is very flexible and will stand the wear of heavy service in both wet and dry places. It is recommended for speeds up to 4000 feet per min.

Lanco Balata

Here is the ideal belt for long service in places where the conditions change from wet to dry. It can make good under almost any conditions except those of heat. It is made of strong 38 oz. duck woven to the utmost tightness it is possible to weave it. This belt will not go back. It is stretched and impregnated with pure Balata gum by our secret process, giving the maximum of wearing quality. It is as nearly stretchless as it is possible to make it.

We carry a large stock of both Scandinavia and Lanco Balata Belts in Toronto and Montreal. Lanco Balata belts can be made endless on short notice.

In the Beginning—That's when you must use the greatest care in selection. If you rely merely on promises however sincere you stand to lose money, time and efficient service. Our belts are tried and proven successful. Our claims are based on *experience*.

In the End:—That's when Scandinavia and Lanco Balata belts cost you least. For *experience* has shown you that their life is long.

**Make Sure of Your Belting Efficiency
Before you buy—You can Rely on our belts.**

We have just issued a new belt book dealing with both Belts besides giving valuable information useful to every belt user.

HOSE

For Greater Protection---For Longer Wear

¶ The Goodyear Hose-making equipment is the most up-to-date in Canada. We have the latest improvements known to the trade. Every process is under the control of experts, who know the Goodyear requirements and see that a uniformly high standard of quality is kept up.

¶ We take no chances with the raw materials. A stringent laboratory examination determines the quality of the raw rubber. The hard long-fibre cotton which is specially woven for Goodyear Hose-making is submitted to tests for strength and weave.

¶ The walls of the hose are composed of long strips of cotton fabric thoroughly impregnated with rubber or friction. And cut on the bias to resist expansion, bursting and elongation. This friction-impregnated fabric is rolled under great pressure, which ensures a perfect union of the plies.

SUCTION HOSE

¶ We build into Goodyear Hose the same strength and indestructibility as have made Goodyear Rubber Belts famous. Goodyear Suction Hose is steel-wound internally to guard against collapse. The coil is of round or flat wire, and round it the hose is built up, ply upon ply of rubber-permeated cotton fabric. This fabric is made from special hard-staple long-fibre cotton, and is cut on the bias to give strength and hard wear.

¶ Goodyear Suction Hose is made for every purpose—and can be had rough or smooth bore. Is in service throughout Canada—on wrecking and dredging contracts—in factories and mines—on farms and in saw-mills. Special hose made for sand-sucking, oil, gasoline, vinegar and acid, wine, etc.

STEAM HOSE

¶ Steam Hose gets more hard usage than any other hose. In the Boiler Room it lies around near the furnace and is scorched—a hot firing tool is carelessly thrown down upon it—oil is spilt over it.

¶ Goodyear Steam and Hot Water Hose is made with special heat resisting lining, which keeps the extreme heat from the friction fabric. This gives the extra durability—it will stand up well under hard usage. In its manufacture the materials undergo special treatment to resist oil—so destructive to common hose. The rubber and duck used in Goodyear Steam Hose are specially tested for service under high pressure of steam and hot water. We supply it steel wire wound or marine jacketed.

GOODYEAR MILL HOSE

¶ When Mill Hose is wanted it is wanted badly. To find that your Mill Hose has cracked and rotted while lying idle is serious. "Goodyear Underwriters" is always ready for effective service. We build this hose to meet the requirements of the Associated Factory Mutual Fire Insurance Companies. It bears the required stamp of approval "tested to 200 lbs. pressure." The inner tube is made from NEW Rubber of the highest grade, uniform in thickness and quality. The cotton fabric is of special circular web woven to the Underwriters' specifications for a minimum of expansion or elongation under pressure. It is antiseptically protected against rot and mildew.

¶ For Factories and Mills the "Goodyear Underwriters" is a hose which will lower insurance rates, and cannot be excelled in durability and strength. You see it everywhere—the hose with the black and yellow stripes.

GOOD YEAR

**RUBBER
HOSE**

AIR HOSE

¶ With fair usage Goodyear Air Hose will be found proof against internal decay from oil—breaking away of pieces of the tube—and clogging of the machinery. The lining is made from selected rubber and cured to prevent hardening from the heat and pressure.

¶ Goodyear Air Hose will give good service under intermittent pressure.

¶ In mines, engine and boiler works, steel construction contracts—wherever pneumatic tools are being operated you will find Goodyear Air Hose. Wire or marine winding or marine jacket.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 33

Toronto, August 15, 1913

No. 16

A Great and Growing Industry

Each year, when the time comes around to publish the annual issue of the Canada Lumberman, the conditions of the lumber trade and its history during the year that has passed, present features which make it distinct from the trade in the years which have gone before. There is always a refreshing individuality about business conditions. If trade is prospering we are continually telling one another about the new records that are being made. When the finger of progress hesitates, we commence to look back for examples in the past from which to draw information regarding the probable course of events in the future; but in few instances do we find that the records of the present year, or the events of the past, afford a true parallel from which to draw conclusions about the future.

The last serious trade depression in Canada and the United States, and in fact the world over, was that of the year 1907. It was a bad one and its effects took a long time to wear off. It was a result, to a large extent, of overproduction and of over capitalization. At the beginning of the year 1912, only three or four years after the effects of the previous depression had cleared away, trade was bounding along before the wind with all sails set. In the fall of 1912 a storm broke. Wars commenced in various parts of the world. The crop movement added to this, brought about tight money. In Canada, real estate speculation had been going mad for a year or two and large sums of money were tied up in non-productive speculative properties. In the United States, political conditions, contributed along with labor disturbances to a general feeling that hard times were due. They were due, and they came, to some extent, both in Canada and the United States, but those who had their ears to the ground understood that the depression was largely an artificial one, imposed by the banking interests, by way of a check upon unwise speculation.

Inasmuch as the lumber trade affords an illustration of trade con-

ditions generally, the ideas expressed above are closely borne out by it. The Canada Lumberman, itself being, in a large measure, a barometer of trade conditions, gives an encouraging indication of the general feeling of the trade at the present time. This special issue, being an annual feature, affords an interesting basis upon which to estimate future conditions and from which to analyze those of the immediate past. Those who wish to obtain an idea of the present lumber trade conditions in Canada should analyze the present issue of this journal. They will find in its advertising pages a wonderful tonic for business depression or financial nerves.

The first impression which such a publication must give is that the trade is a progressive, vigorous and important element in the development of the country. The second impression is that an industry which spends money on advertising to such an extent is not only prosperous, but wideawake. The greatest force in the business world today is advertising. It is the concentrated result of competition. Money which is spent upon it is capital expenditure. The competition which has led to the development of advertising, and the competition which has resulted from it, have brought about a quickening of the business instinct of the whole reading world. It has resulted in inventions, economies and business policies that were never dreamed of in earlier days. More definitely than any other single force has advertising been responsible for all this. It can truly be likened in the commercial world, to the power of steam in the engineering world. It has opened up new fields and has shown men possibilities which were formerly unthought of.

In the field of lumber trade journalism, advertising has played as great a part as in any other. Each year new names are added to the list of advertisers, from among those who were formerly content to carry on their business without its aid. The present year has been marked strongly by this feature. The Canada Lumberman is pleased to find that many of its old acquaintances who had formerly neglected advertising, have this year come forward willingly and joined the great body of those who believe in publicity.

In bulk alone, the present annual number of the Canada Lumberman surpasses any of those which have preceded it. The readers and advertisers are responsible for this growth. They have come forward with their money and their ideas and have enabled us to present to the lumber trade in Canada and in many other parts of the world where the journal is read, a remarkable reflection of the trade itself and the conditions which prevail in it. We believe that the advertisements and the articles in this issue combine to picture the lumber trade of Canada in a manner which could not be approached if the best versed men in the industry were to devote many years of his life to the production of a book with the same object in view. This issue is a reflection of the ideas, the achievements and the hopes of the lumbermen in Canada during the past year. It shows that the reaction in trade which prevailed during the last quarter of 1912 and the first half of 1913 has not affected their faith in the importance of the lumbering industry, or in the greatness of its future. It shows that lumbermen, machinery manufacturers, supply firms and a hundred and one others who take an interest in the conversion of trees into lumber, are ready to back up their works with faith and with funds.

The reading columns of this issue show above everything else the diversity and youthfulness of the lumbering industry in Canada. It is many years now, since we first heard the cry that the lumbering industry in Canada was on the wane, and still the trade is spreading out and we are able to illustrate and describe in this issue many new plants which have been constructed in all parts of Canada, for the manufacture of lumber and its conversion into finished products. We are able to show that the growth of the lumbering industry continues vigorously, and that, though the old order changes, it also gives place to the new. The timber trade of the early days has almost become a memory, but the pulp and paper industry of today has become a great factor in the world's trade. In many other directions the lumbering industry is broadening out. Its immediate future presents nothing to fear; its present is sound and its past is one of which to be proud. When another year has passed away we hope and we believe that the same facts, in new garb, will bear repeating.

Many Million Feet of Fine Lumber—Panoramic View of Pembroke's Waterfront—Mills of Pem-

A Leading Lumbering Town—Pembroke, Ont.

Ideally situated on Allumette Lake, an expansion of the Ottawa River, about eighty miles from Ottawa, lies the town of Pembroke, one of the most, if not the most, important lumber centres in the North Country. Here are located the mills of the Pembroke Lumber Company, The Colonial Lumber Company, Limited, the headquarters of several of the most prominent lumbermen of Ontario, and a number of important industries closely allied with the lumber trade.

The place was originally called Miramichi, a name derived from the emigrants who came from Miramichi, N.B., after they had been burned out during the great fire there in 1825.

Seventy years ago this portion of the Ottawa Valley was a vast forest. Mr. Peter White the well-known Pembroke man was the first settler there, and may be said to have laid the foundation of the town. Mr. White, was born in Edinburgh, arrived in Pembroke in 1828 and it

was in that year the first tree was felled on the clearing. In 1831 the first saw mill was erected there by a Mr. McKay and it is needless to say he did not have far to go to secure his logs.

Pembroke was incorporated as a town in 1887, and its progress since then has been rapid and marked.

In January, 1861, Pembroke was made the county town for the county of Renfrew. The population of Pembroke at the present time is about 7,000 and the slogan of the Pembroke Board of Trade "A city in two years" is in a fair way to be realized.

Pembroke offers many advantages for manufacturers especially those industries allied to the lumber trade. Because of its advantageous surroundings, its commercial facilities, its business opportunities and its advantages as a shipping and distributing point, it is attracting capitalists and business men from all over the country. It is situated

Where the Logs Enter—Log Deck of the Pembroke Lumber Company, Pembroke, Ont.

broke Lumber Company and Colonial Lumber Company may be recognized easily in this view.

too in the north country in the centre of a great saw-milling district where the demand for supplies of all kinds pertaining to that industry is great. Above all it has unlimited hydro-electric power at \$12 per h.p.

Pembroke's railway facilities are unexcelled. The Canadian Northern Railway is not only contemplating entrance into Pembroke but is considering the advisability of making this enterprising Ottawa Valley town a divisional point, which would be a great asset to the town. In fact, the town council is prepared to give the C. N. R. a bonus of \$25,000, twenty years' exemption from taxes and free water if they decide to make Pembroke the divisional point. The main line will pass just south of the town and they will probably come in over the Grand Trunk tracks, and in consequence will co-operate with the Grand Trunk in the erection of a Union Station, the plans of which have already been gotten out by the Grand Trunk. In addition to the C. N. R. proposals, the Grand Trunk purpose spending \$25,000 enlarging their yards.

Pembroke is also on the main line of the C. P. R. Montreal to Winnipeg, and on the proposed route of the Georgian Bay Canal.

Pembroke possesses what every town must have to grow and pro-

gress; business men with unlimited faith in their town—faith that will not deter them going down in their pockets and subscribing to stock for any new enterprise that will locate in the town. It is a noticeable fact that nearly all industries there are being financed by local men. The Pembroke Board of Trade is a live organization working in perfect union with the object in view of making the town "A City in Two Years." The officers are J. W. Smith, President; E. A. Dunlop, M.P.P., Vice-President; J. L. Murray, Secretary; M. Howe, Treasurer.

In this article are included descriptions of a number of the Pembroke industries which are allied to the lumber trade. Quite recently a new concern has been organized there. The Steel Equipment Company, Limited, which has erected a large and modern factory for the manufacture of steel office appliances and which will employ about 125 hands.

As a lumber producing centre Pembroke mills cut over 60,000,000 feet annually.

The Pembroke Lumber Company

One of the most successful lumbering concerns in Canada and one which has established an excellent and wide reputation for high-class

Delivering the Lumber—Fine Horses owned by the Pembroke Lumber Company, Pembroke, Ont.

Saw Mill and Sorting Table—Pembroke Lumber Company

Sash and Door Factory—Pembroke Lumber Company

products, not only in Canadian markets, but in foreign markets as well, is the Pembroke Lumber Company, Pembroke, Ont. The company was incorporated in 1890, the officers at that time being the late A. T. White, of Pembroke; the late Arrunah Dunlop, of Pembroke; the late Judge Thos. Deacon, of Pembroke; the late Hon. Peter White, of Pembroke; Mr. C. Chapman, of Pembroke, and Mr. John Bromley, of Pembroke. The present board of the company is made up of the following:—Mr. E. A. Dunlop, M.L.A. for North Renfrew, president; Mr. G. V. White, M.P. for North Renfrew; Mr. Peter White, K.C., secretary; Mr. J. D. Deacon, of Pembroke; Mr. C. Chapman, of Pembroke, and Mr. John Bromley, of Pembroke.

From the year 1890 until 1905 the president of the company was the late Judge Thomas Deacon who was succeeded by E. A. Dunlop, M.L.A., who still occupies that position. From 1890 to 1901 the manager of the company was Mr. John Bromley who was succeeded in the latter year by his son, the well-known wholesale lumberman of Pembroke, Mr. W. H. Bromley, who in turn was succeeded in 1910 by Mr. A. L. Eastcott, formerly of Hawkesbury, where he was with the Hawkesbury Lumber Company.

The Pembroke Lumber Company operate extensively, owning about 1,300 square miles of good timber limits, all tributary to the Ottawa River situated on the Indian, Petawawa, Dumoine, Mattawa and Jocko Rivers, as well as a large frontage directly on the Ottawa River at Stonecliffe in Quebec province. Upon these limits they still have many years of good cutting operations ahead. Their annual production amounts to about twenty million feet, chiefly composed of white pine. The company specialize in the production of timbers of long lengths and large dimensions and they find their markets chiefly in Canada and Great Britain. During the present year, as a result of their rapidly expanding business, they have found it necessary to install two double-dutting band mills, one Wickes gang and one horizontal

Large Frames for Railroad Work Shops—Made by Pembroke Lumber Co.

band re-saw. They now pride themselves upon having the most up-to-date plant in the Ottawa Valley.

Three years ago the Pembroke Lumber Company started a sash and door factory. As with their other industry, they found the business for this plant increasing so rapidly that its size had to be enlarged. To-day they are operating a thoroughly modern factory.

Looking Down the Mill—Pembroke Lumber Company.

Group of Employees—Pembroke Lumber Company.

A Successful Wholesaler—Wm. H. Bromley

W. H. Bromley, Pembroke, Ont.

Wm. H. Bromley, Pembroke, Ont., is one of the best known wholesale lumber dealers in the province. He was born at Pembroke on September 13th, 1873, and was educated at the Pembroke public and high schools and the Ottawa Business College. In 1891 he commenced his business career in the employ of the Pembroke Lumber Company, being engaged in their woods work. After five years experience in the woods he was transferred to the mill at Pembroke where he was appointed assistant to his father Mr. John Bromley. In 1901 he succeeded his father as manager of the Pembroke Lumber Company's operations at Pembroke, a position which he held until 1910, when he resigned to enter the wholesale lumber trade on his own account. Since that date he

has devoted his attention chiefly to the trade in white and red pine at Midland and Pembroke. His head office is at Pembroke, Ont., and he makes frequent visits to Midland in order to look after his interests at that point.

Mr. Bromley is interested in a number of other industries, among them being the Pembroke Woollen Mills, Limited, The Pembroke Transportation Company and the Lee Manufacturing Company. In addition to looking after his own interests, Mr. Bromley devotes much of his time to municipal work. In 1905-6 he was Mayor of Pembroke and since 1907 has been Deputy Reeve and Reeve of Pembroke. During the present year he occupies the position of Warden of Renfrew county.

In 1899 Mr. Bromley was married to Margaret, eldest daughter of J. M. Poitras of Seattle, formerly of Deseronto, Ont.

Clarke & Andrews

Located in the north country in close proximity to lumbering operations, nearly all of Pembroke's industries cater to that great industry. Clarke and Andrews are no exception. "Everything for the Horse" is their motto, and many logging teams in the north country are equipped with their harness, blankets, etc. The senior member of the firm has been in business in Pembroke for 53 years. In 1904 he entered into partnership with Mr. Geo. Andrews and branched out in the manufacture of harness and leather goods, of which they turn out great quantities. Horse blankets and robes, and leather goods of all kinds are now carried in stock and in addition to their wholesale business they also enjoy a large retail trade in Pembroke and the vicinity. Mr. Andrew attends personally to a large share of the selling to the lumber camps, among which he is well known and always a welcome visitor.

The Colonial Lumber Company

The large mill of the Colonial Lumber Company, Limited, Pembroke, Ont., is situated on the waterfront near the C. P. R. station. Every one who is connected with the lumbering industry of the Ottawa Valley knows that the Colonial Lumber Company occupies an exceptionally prominent place among the great industries of that district. Extensive lumbering operations have had their headquarters at this site for upwards of thirty years from the time when Messrs. A. & P. White were among the leading lumber firms operating on the upper Ottawa and its tributaries. Between seven and eight years ago the original firm was bought by the Colonial Lumber Company of Pembroke, Ont., who rebuilt the mill in the winter of 1905-06 and installed an equipment which ranks it as one of the most efficient and up-to-date saw mills in the Ottawa Valley. The output is mostly pine, but spruce, ash, basswood, hemlock and tamarack are included, while the company also have upon their limits important quantities of oak, birch and other hardwoods.

The mill contains one double cutting band saw with gun-shot feed and steam set works, a twin circular saw for slabbing and a circular gang saw for cutting the cants from the twin slabber. This gang includes fourteen saws cutting from

W. R. Beatty, Secretary of Colonial and Petawawa Lumber Companies.

J. W. Smith, Vice-Pres., Colonial and Petawawa Lumber Companies.

one inch to two inches in thickness. It will cut cants up to ten inches and is especially adapted for making lumber from small logs.

The smaller machines in the mill include two-saw edgers, a three-saw edger and a set of slash saws for cutting slabs into lath and picket lengths. The plant also includes three picket mills and one lath mill, and the necessary saws for trimming lath, etc. The logs are fed into the mill by two separate jack ladders. The power plant includes a 450 h.p. engine, a 50 h.p. engine, and a small engine for the filing room machinery. The boiler house contains five 125 h.p. sawdust oven boilers and one Dutch oven boiler, all fed automatically with sawdust collected from the mill.

The sorting table is located 140 feet from the mill, the lumber travelling to it on live rollers. This table is 200 feet long and from it the lumber is loaded on to cars for distribution in the yards. One yard is located near the mill and the other about two miles below Pembroke, on the line of the C. P. R. The yard capacity is 25,000,000 feet.

The company's boom capacity will accommodate 140,000 logs. The mill cuts on an average about 2,000 to 2,500 logs or 125,000 to 160,000 feet of lumber per ten-hour day. This is in addition to about 35,000 lath, 25,000 pickets and 15 cords of firewood.

All the machinery in this plant, as well as the engines, boilers, etc., were manufactured and supplied by the Wm. Hamilton Company, Peterboro, Ont., who also handled the contract for the erection of the mill and the installing of the plant.

The officers of the Colonial Lumber Company are: E. J. Chamberlain, president; J. W. Smith, vice-president; W. R. Beatty, secretary.

An extensive illustrated description of the Colonial Lumber Company and its operations giving more complete details was published in the Canada Lumberman of September 1st, 1911.

Colonial Lumber Company, Pembroke, Ont., view of sawmill from the west.

The Thos. Pink Company, Limited

Thomas Pink, Pembroke, Ont.

The Thomas Pink Company, Limited, manufacturers of lumbering and driving tools, have been established in Pembroke since 1866, and are the oldest manufacturers of this class of goods in Canada. Mr. Pink, the founder of this concern, came to Pembroke in 1865 as a blacksmith and worked in that year for Koping and Walker, who built the jail and court house. The following year Mr. Pink opened a blacksmith's shop in town and since that year his progress has been steady and marked until today, large and spacious factories for the manufacture of everything in iron for the lumberman are to be found in the town. The firm specializes in peavies and cant dogs and their brands in this line are to be found from coast to coast. Over thirty men are employed regularly in the different departments of the works. Several

years ago fire wiped out the main building, but with the perseverance that has characterised his whole business career, within a very short time large and more modern buildings were erected on the old site.

The Petawawa Lumber Company

The Petawawa Lumber Company, Limited, whose mill is located at Petawawa a few miles up the Ottawa River from Pembroke, have their head office in the town of Pembroke. The company was only formed in 1911, but they are to-day carrying on a most extensive and successful lumber manufacturing business. They purchased the timber limits of Fraser and Company in Hunter and Devine townships and the saw mill plant, etc., of A. & F. Fraser. The limits operated by the Petawawa Lumber Company contain all virgin white pine of excellent quality. The Waterous Engine Works Company have supplied the mill with:—two 72 x 18 boilers, 20 x 24 in engine log haul up and steam nigger, kicker and log loader 10 in. x 24 ft. gun-shot feed 42 in. opening steel carriage and 8 ft. double cutting band mill 48 in. new Champion edger, trimmer, slab slasher, conveyors, live rolls and drives, filing tools, etc. The mill has an average output of 50,000 feet per day. The officers of the company are as follows:—R. Booth, president; J. W. Smith, vice-president; Senator Geo. Gordon, treasurer; W. R. Beatty, secretary.

Dunlop & Company, Limited

If any of the lumberman in the north country were to be asked where they get their lumber hardware, almost invariably the answer would be Dunlop & Company of Pembroke. The expansion of this concern has been steady year by year, until now their travellers cover a wide territory in Northern Ontario. From 1860 to 1893 the firm was known as Dunlop & Chapman, and in the latter year Mr. Chapman dropped out and Mr. E. A. Dunlop, the present popular representative for North Renfrew in the Provincial House, took charge and changed the firms name to Dunlop & Company. Some idea of the growth of this large hardware firm can be obtained from the fact that in 1895 the amount of business done amounted to \$24,000, while \$400,000 represented the turnover during the past year. The man responsible in a great measure for the success of the firm is the present manager Mr.

Dunlop & Company's Hardware Headquarters, Pembroke, Ont.

F. W. Cockburn. Mr. Cockburn has been connected with the business for 18 years, and has been manager since 1904. His policy of steady expansion has met with unqualified success. His close application to business has resulted in their present prosperity. The firm has recently been incorporated as a limited liability company with Mr. Dunlop as president, and Mr. Cockburn as vice-president and manager.

The Lee Manufacturing Company, Limited

Among the important and busy industries of Pembroke, the Lee Manufacturing Company, Limited, operating a woodworking factory at the corner of Pembroke and John streets and an iron foundry situated on the River Road, occupy a prominent place. Both of the buildings are substantial brick structures, of imposing appearance, ideally situated and nicely suited to the requirements for which they are used. Anyone who is familiar with Pembroke in the early days, will recall the Metropolitan Hotel. The site of this famous old hostelry has been converted into the up-to-date wood-factory of the Lee Company. Quick-action machinery and modern factory methods are provided for transforming raw lumber into incubators and brooders and poultry accessories, kitchen cabinets, refrigerators and similar woodenware which are sold in all parts of Canada.

In the foundry of the Lee Company there is produced a fine line of steel and cast stoves. In viewing the plant the attention of the Canada Lumberman representative was drawn to the lumbermen's ranges and heaters, and the secretary of the company, Mr. J. L. Murray, very proudly pointed out a shipment that was just leaving for a northern lumber camp.

In the Lee Company plants upwards of 75 hands are employed and the annual payroll is about \$45,000. One feature that indicates the substantial benefit such an institution is to a town is the fact that the labor is employed all year round. Local capital and local men have developed the business from its inception. The officers are:—Peter White, president; W. F. Fenton, vice-president; Thomas W. Lee, managing-director; J. L. Murray, secretary, and James Smith, Jas. F. Munro, John W. Smith and E. A. Dunlop, directors.

Factory of the Lee Manufacturing Co., Limited, Pembroke, Ont.

Foundry of the Lee Manufacturing Co., Limited, Pembroke, Ont.

Pembroke Woollen Mills, Limited

A Pembroke industry which is making great strides is the Pembroke Woollen Mills, Limited, manufacturers of blankets, flannels, tweeds, kerseys and stocking yarn. Their lines of white and grey blankets and coarse tweeds are especially suited for the lumber trade, among whom they have large accounts. The business was started in the fall of 1909, the original building being 48 ft. x 96 ft., two storeys and basement, and was what is known as a one sett mill. Business increased so rapidly that, in the fall of 1912, expansion was imperative and additions were made until now the main building is 48 ft. x 200 ft., the picker room 30 ft. x 30 ft., the dry room 30 ft. x 30 ft., and the store room 30 ft. x 30 ft. for raw stock, and it is now a three sett mill.

Mr. W. H. Irving, treasurer and manager of the company, has had a life-long experience in this business and it is to his capable management and determination to turn out nothing but first quality goods that the steady expansion is due. The industry was started with local capital and all the directors and officers are men living in Pembroke. They are:—James Smith, President; Jas. F. Munro, Vice-President; Wm. H. Irving, Treasurer and Manager; E. A. Dunlop, M.P.P., W. H. Bromley, G. V. White, M.P., Thos. H. Moffatt, W. H. Hunter.

Newfoundland News Notes

The Newfoundland rivers were full to overflowing during the spring and early summer of the present year. This was unexpected, as the light fall of snow made lumbermen nervous regarding their drive water, but copious rain more than supplied for the shortage in snow. Consequently, all the drives, with very few exceptions, reach-

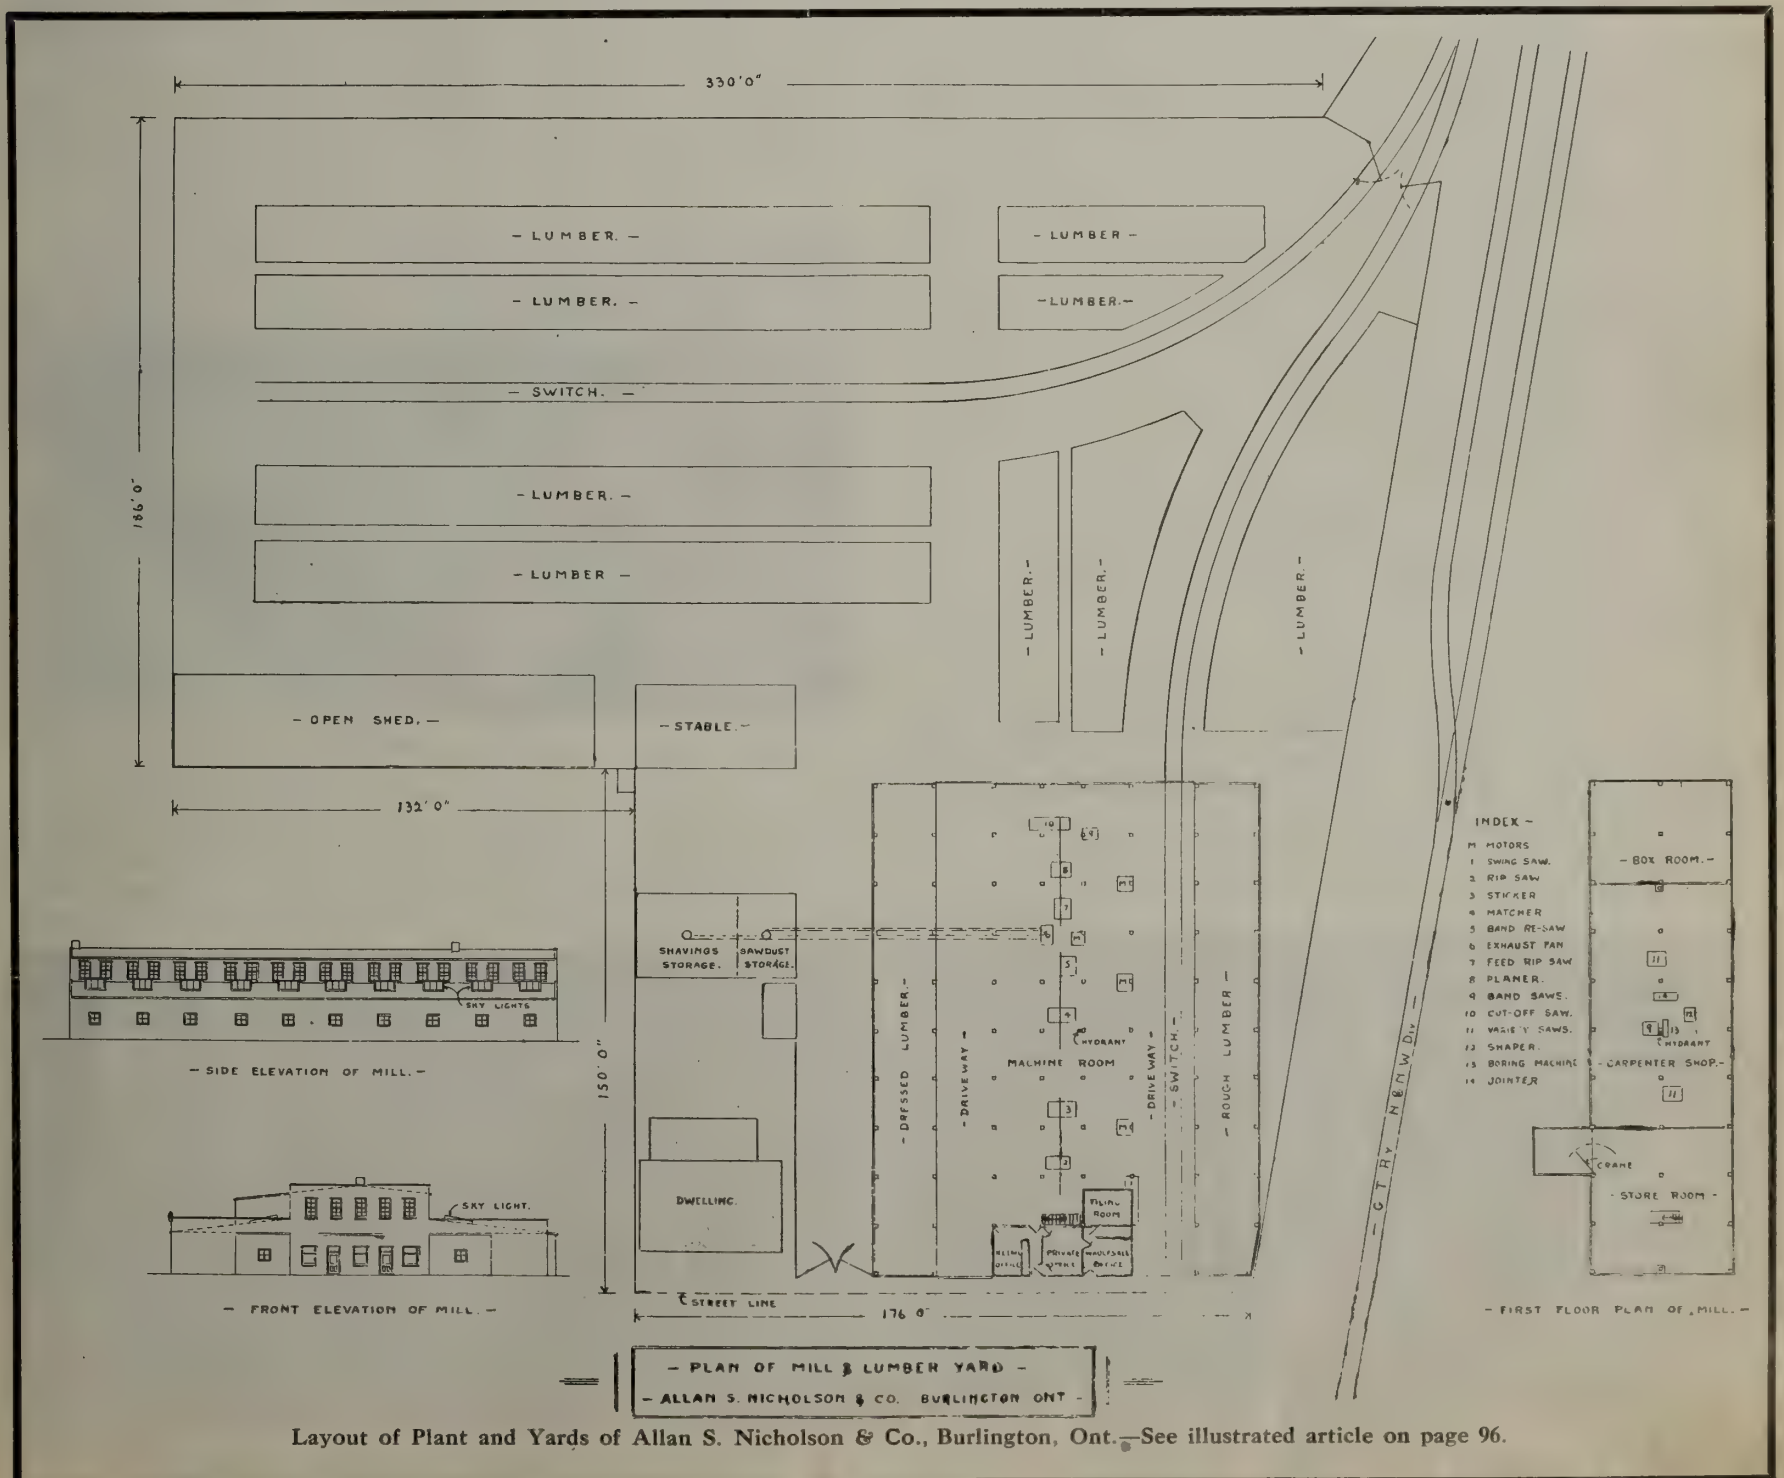

ed their destination, and the mills were all put in operation. H. J. Crowe, of Botwood, recently loaded a cargo of 1,700,000 feet for South America. The Henry Patton Company's mill at Norris Arm will make an average season's cut. A large number of small mills are in operation, and on the whole will doubtless come up to former years.

The consumption this year will probably be larger than usual, so far as the local sales are concerned, due to the fact that a good many works of public utility are in progress, and ordinary building is somewhat on the increase.

A serious accident occurred recently at Alexander Bay, where the boiler of Alexander Rose exploded about eight o'clock in the forenoon, resulting in six deaths, everybody present being killed instantly. The explosion must have been one of great intensity, as the mill was completely wrecked and the explosion heard and felt for miles around. As everyone in connection with the mill was killed, it is very difficult to glean any information that would result in forming a theory as to the cause. The boiler was of the locomotive type, and the explosion leaves it rent and torn to pieces. The inference is that the water must have run low enough to expose the crown sheet, with the usual result in such cases. Mr. Rose had been operating this mill for some six years. He ran about 25 to 30 h.p., and had just begun to saw for the season.

A small mill, owned by Mr. Mark Gibbons, of Gambo, was destroyed by fire early in June. The annual visit of forest fires need hardly be feared this season, as the critical time is now passed and the weather has been so continuously wet that there has been no chance for a fire to start. Nevertheless, the fire patrol is working continually all around the railway limits.

Layout of Plant and Yards of Allan S. Nicholson & Co., Burlington, Ont.—See illustrated article on page 96.

Business Expansion at Burlington, Ont.

Progressive Business Methods Compel Allan S. Nicholson & Co. to Erect Plant with Increased Capacity and Latest Equipment

Allan S. Nicholson, Burlington, Ont.

The accompanying illustrations give a good idea of the interesting and efficient plant of Allan S. Nicholson & Company, Burlington, Ont., one of the most progressive among the recently established lumber businesses in the province of Ontario. Mr. Nicholson has been brought up in the lumber business and is endowed with one of those keen and practical business instincts which is quick to see an opportunity and develop it to the utmost. After he had acquainted himself thoroughly with the lumbering industry in its many aspects and saved enough money to put himself into business, he studied various localities and settled upon Burlington as one of the most promising of them all. His judgment during the short time that he has been in the business in Burlington,

has been justified most amply.

The business at Burlington was founded many years ago by Mr. A. B. Coleman, and after being burned out about 1898, was re-established by Mr. James Harrison, who carried it on till about five years ago, when A. S. Nicholson purchased the business and took charge. The yard was then located in rather small quarters on a down-town site on Brant street and was strictly of a local nature. Mr. Nicholson remained in business in the same style for a few years until it began to develop into a much larger business under his energetic management, when he opened a branch yard in Hamilton to take care of his Hamilton business. This business also proved a success, but Mr. Nicholson sold this yard about a year ago to Messrs. Winlaw-Irvine Lumber Company, of Toronto. At the same time finding his premises entirely inadequate to handle the business and being on expensive property, Mr. Nicholson found an excellent opportunity to sell the property and move to a less expensive location adjacent to the Grand Trunk Railway. Last November he commenced the erection of the plant shown in one of the accompanying illustrations. He superintended everything in connection with the new building and completed the whole plant in ninety days. It now employs forty to fifty men, and carries a stock of from 1,500,000 to 2,000,000 feet.

Extensive Planing Mill Equipment

The equipment of the planing mill is thoroughly up-to-date consisting of fourteen machines such as a Cowan & Company self-feed band re-saw, a Berlin No. 108 fast feed planer and matcher, a Ballantyne 12-in. sticker and moulder, a Preston Woodworking Machinery fast feed power rip-saw, etc. The work done consists of general planing mill work, such as the manufacture of flooring, ceiling, siding, mouldings, etc. The second floor of the mill is especially

Plant of Allan S. Nicholson & Co., Burlington, Ont.

equipped in the main department for the manufacture of frames, stairs, newels, columns, and all detail work. There is also on the second floor a box factory, which is at the present time being equipped for the manufacture of bushel apple and pear boxes, for which there is a large demand in the Burlington district.

On the first floor of the mill, especial attention is given to milling in transit. As readers will see by the accompanying plan, a siding runs through the mill so that lumber for transit milling can be unloaded directly at any of the machines. After it is milled it is re-

A well filled yard at plant of Allan S. Nicholson & Co., Burlington, Ont.

loaded on cars by means of a set of liverollers, which convey the lumber from the machines right into the car, being loaded with the least possible amount of time and labor. The construction of these live rollers is simple but such that they can be easily and quickly

Ground floor interior—Allan S. Nicholson & Co., Burlington, Ont.

First floor interior—Allan S. Nicholson & Co., Burlington, Ont.

moved to any machine. They can also be used for unloading or re-loading material into or from the shed at the side of the mill. There is also installed in the mill a complete blower system, which deposits the shavings and sawdust in separate vaults, keeping the mill entirely clean of shavings and sawdust at all times.

The layout of the yard is such that the sidings are placed so that all lumber can be piled from cars on to piles in any part of the yard without loading on wagons or trucks. This also saves much expense.

Mr. Nicholson's Other Interests

Quite recently, Mr. Nicholson established another retail yard on Ottawa street, Hamilton. This is run under the name of "The Beaver Lumber Company," and under the present management this is also certain to prove a success. The necessity for this was brought about by the steady increase of the Hamilton business, which could not be handled successfully from the Burlington yard. The Burlington mill, however, supplies all the manufactured material to the Hamilton yard.

Mr. Nicholson is also in the wholesale business in no small way, having, in January last, formed a partnership with Mr. A. J. DeLaplante, of Buffalo. This company has taken over the business of the DeLaplante Lumber Company, Limited, and does business under the name of "DeLaplante & Nicholson." They carry large stocks of hemlock, spruce and pine at northern points and make a specialty of supplying mixed cars of milled material, having cars milled in transit at Burlington.

Mr. Allan S. Nicholson is a young man of untiring energy and from the past success of his business ventures and the steady growth of the district in which his interests are situated, we are convinced that the continued success of this concern is assured, and we have noted with interest the rapid manner in which he has, during the last few years, come to the front among the many successful lumbermen of Ontario.

An Enterprising Hamilton Company

Five Years Witness Growth from a Small Business to One of Leading Importance—Growth Continued in 1913

There are few consumers of lumber in the city of Hamilton, Ont., or its neighboring district, and few wholesalers of lumber in Ontario, who do not know the Consumers Lumber Company, Hamilton, the owner of which is Mr. Guy H. Long. The Consumers Lumber Company had its origin in the year 1908, when it was formed by the late M. S. M. Long and Guy H. Long. The beginnings were quite modest but the growth of the company has been proportionate to the growth of the whole district which it serves. In its early days the Consumers Lumber Company had very little capital on which to do business. They used one horse and two waggons for making their deliveries and one man in the yard was all that was necessary for the handling of stocks. In spite of this small beginning the company managed to turn over stock to the value of \$30,000 during their first year. At present their business is extending very rapidly and they now conduct two yards, one at the corner of John and Hunter streets and one on Wentworth street south. When taking stock last year they found that their stocks amounted in value to \$60,000. During the first six months of the present year they report that they have sold lumber to the value of \$117,000, an increase of 70 per cent. as compared with the six months previous. They are confidently expecting to pass the \$200,000 mark this year.

At the present time the Consumers Lumber Company employ seven horses and fourteen wagons in their business. At each yard they employ one yard foreman and an office staff of three. In con-

nection with the two yards they also employ a collector. They have always believed in the value of publicity. In addition to advertising in print they have adopted a unique method of keeping their name and business before the public of Hamilton by adopting a set of colors for their wagons, fences, office stationery, etc. They have been able to identify these colors, yellow and black, in the minds of the trade, with their own particular business. They have even gone so far as to use only black horses in their deliveries. They report that the results of this scheme are very satisfactory and that they intend to adhere to it as the business increases.

The Consumers Lumber Company is kept entirely supplied from the wholesale business conducted by the Long Lumber Company. The Consumers Lumber Company makes all its own business arrangements, keeping its own books and doing its own buying. It is under the management of Mr. Roy C. Anderson. The company handle large quantities of Klimax doors, Beaver Boards, etc., together with a good assortment of all kinds of lumber, lath, posts and shingles. In accounting for their rapid extension the company claim that it is due, more than anything else, to a policy of making quick deliveries and handling a high class of lumber.

The Consumers Lumber Company intend in the near future to erect a large planing mill in their No. 2 yard, located on Wentworth street south. It is expected when this mill is in operation that their sales for 1914 will be increased at even a greater rate than previously.

The Consumers Lumber Company is a limited company with the following Board of Directors:—Guy H. Long, president; F. R. Burton, vice-president; J. Marshall, secretary; H. P. Brierley, director; R. B. Stewart, director.

A Record Year for the U. S. Forest Service

All previous records were surpassed by the business done by the national forests of the United States during the fiscal year ending June 30 last. The receipts from the forests approximated \$2,500,000, of which about one-half was for timber. Contracts entered into for the sale of timber to be cut either at once or in later years amounted to about \$4,000,000. These sale contracts, it may be said, permit the cutting to extend over a number of years when large bodies of timber are involved. A review of the records indicates that while there has been considerable fluctuation in the volume of sales contracted for from year to year, the receipts from timber have shown a fairly steady advance. In the fiscal year ending June 30, 1907, the forest service sold more timber than has since been sold in any later year prior to that just closed. Contracts were made in the fiscal year 1907 covering over 1,000,000,000 feet board measure. In the following year, the panic having intervened in the fall of 1907, less than 400,000,000 feet were sold, and in 1909 less than 300,000,000 feet were disposed of. More timber was cut under preceding sales in both the latter years than was disposed of through new sales, cutting under earlier purchases continuing even in periods of depression. The timber receipts for the fiscal year 1906, the first full year after the forest service was put in charge of the forests, amounted to \$250,000. Those for the following year amounted to something under \$700,000, and those for the fiscal year 1908 totalled about \$850,000. There was a falling off to less than \$750,000 in the following year, but since 1909 there has been an upward tendency. The timber receipts in 1910 and in 1911 were over \$1,000,000; in 1912 they amounted to nearly \$1,100,000, and in the fiscal year just closed they reached the sum of about \$1,250,000.

The large amount of last year's sale contracts does not necessarily indicate a large prospective income from timber in the immediate future because the cutting under them may extend over a number of years, and, of course, it cannot now be determined whether the current fiscal year will see sales equal to those of the last one.

Panoramic view of the splendid

Collingwood, Ontario—Its Lumber Industry

Large Woodworking and Lumber Manufacturing Plants Located at this Thriving Georgian Bay Town—An Ideal Industrial Location

Collingwood, Ont., located on one of the largest lakes of the great chain, in a rich agricultural section, is one of the most prosperous and up-to-date of the many towns of the province. The history of this community dates back only about 57 years, for when the Ontario, Simcoe & Huron Railroad was built in 1854, there were only a few hundred scattered settlers within its limits. From that time its advancement and growth have been marked along every line of commerce, and it has become one of the principal ports of entry on Lake Huron. There are few, if any, of the towns in the Province of Ontario, which have a brighter future than Collingwood, for owing to its superb location at the eastern limits of Lake Huron, it is the natural gateway between the east and west, and has probably the best harbor on Georgian Bay. All these natural resources, combined with the rich agricultural sections to the east, are vital factors in the permanent growth and expansion of this city. Collingwood is an ideal spot for the location of mills and factories representing every branch of commercial enterprise, and its transportation facilities are unequalled. It has all the public utilities of a city of much larger size, possesses superior water and sewerage systems, with well paved and shaded streets, the very best facilities for securing light, heat and power at a minimum cost, pure air, ample protection from fire, low taxes and a splendid civic government.

Collingwood's extraordinary advantages in transportation facilities have attracted wide attention. The passenger, express and freight service on both land and water are excellent. The main line of the Grand Trunk passes through, and has immense elevators here, and the great boats owned by the Northern Navigation Company, products

Plant of Wilson Bros., Limited, Collingwood, Ontario.

of the Collingwood Shipbuilding Company, make this a principal port of entry. All these advantages are appreciated by every manufacturer and shipper, and are valuable assets to the wealth, progress and reputation of the community.

The following review of the representative lumbering and wood-

Extensive Plant of The Bryan Manufacturing Company, Limited, Collingwood, Ontario.

Harbor at Collingwood, Ontario.

working companies of Collingwood will be of interest to our many readers, who have always, in the past, recognized that in their stock purchases, Collingwood must be considered as one of the most important markets in the Georgian Bay district.

The Bryan Manufacturing Company, Limited

One of the most progressive and successful manufacturing companies in Ontario is The Bryan Manufacturing Company, Limited, Collingwood, of which Mr. F. W. Bryan is president, the other officers being Wm. T. Herrington, secretary-treasurer, and W. F. Dennis, superintendent. Their plant, which is one of the largest and most modern of its kind, is located at the corner of Huron and Minnesota Streets with a frontage of 238 ft. on Minnesota Street, 1,500 ft. on Huron Street, and 150 ft. on Niagara Street.

The business was founded by F. W. Bryan in 1884, and had its beginning in a modest contracting business in which Mr. Bryan made remarkable success. So rapidly did his contracts increase, that two years later he found it advisable to build a small factory in the east end of the town, in which he installed planing mill equipment for the manufacture of sash, doors and general interior finish for use in the buildings for which he obtained contracts. Other additions were made to this building from time to time and the equipment was greatly increased. The policy of making additions however, in order to keep abreast of the rapid increase in the business reached its limit, and finally, in 1892 it was found necessary to secure a larger property and establish a more extensive plant.

In that year the present company was formed and purchased the property upon which the present plant is located. As will be seen from the accompanying illustrations, they erected a large and splendidly equipped plant upon this site. The plant is equipped with the latest types of machinery for the manufacture of sash, doors and interior finish of all kinds. The company make a specialty of hardwood veneer doors, stair work and high-grade interior finish. The bulk of

their output consists of material especially manufactured to order, as they do not cater at all extensively to the demand for stock lines.

Practically every year since the formation of the company in 1892 it has been necessary to make important additions to the plant. The main factory building contains a floor space of 20,000 square feet. It is 92 x 175 ft. and the dry kiln is 40 x 150 ft. In addition to this the company have two lumber storage sheds, one of which is 50 x 75 and the other 40 x 150, besides stabling for their horses, and other minor buildings. The plant gives employment to between 60 and 75 skilled wood-workers and their assistants. The material handled is chiefly high-grade hardwood, such as oak and mahogany. The company also produce pine doors, sash, boxes, etc. An idea of the extent of the industry carried on by The Bryan Manufacturing Company, Limited, may be secured from the fact that their wage bill amounts to between \$25,000 and \$30,000 annually.

Mr. F. W. Bryan

Mr. F. W. Bryan is one of Collingwood's most prominent citizens. He has served on the town council for a number of years, has occupied important positions in connection with town affairs, and is at present vice-president of the Collingwood Board of Trade. He was born in Coventry, England, on March 11th, 1860. In 1863, he, with his parents, came to this country, and after living in Toronto a few years moved to Collingwood about 1866, where they have resided ever since. In 1880 Mr. Bryan decided to leave home, and went to Toronto where he secured a position with a Mr. Bradshaw, who had a small carpenter shop on Yonge Street, near Bloor. After working here two years he moved to Detroit, and in 1883 after the big fire in Collingwood, which destroyed a large portion of the business section of the town, he returned home and started in the contracting business, and has since erected most of the principal buildings in the town, including the City Hall, Central Public School, Catholic Church, rebuilding Methodist Church, and rebuilding the Presbyterian Church. The firm have at present, along with Mr. Healy, of Toronto, the contract for the erec-

W. F. Dennis, Supt. of The Bryan Manufacturing Co., Limited.

Wm. T. Herrington, Sec.-Treas. of The Bryan Mfg. Co., Limited.

tion of the new Federal Building at Collingwood, which will cost, when completed, about \$150,000.

Mr. Wm. T. Herrington

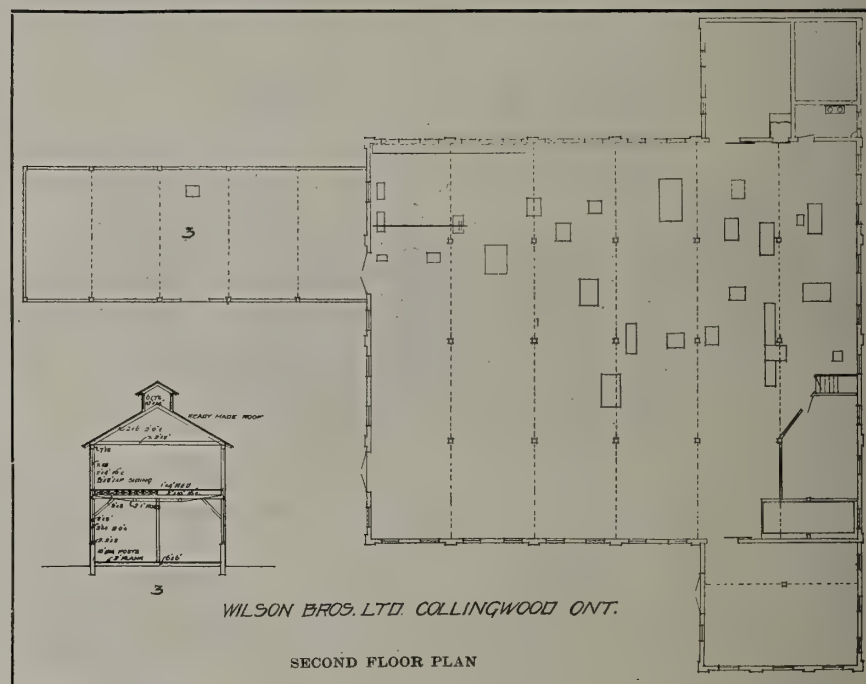

Mr. Wm. T. Herrington, the secretary-treasurer of The Bryan Manufacturing Company, Limited, was born in Collingwood, and has spent all his life in that town. He received a thorough English education first in the Public School and later on in the Collegiate Institute, where he continued his studies till he obtained a teacher's certificate. When his education was completed his mind turned rather to business than to a profession, and he accepted a position of accountant with The Bryan Manufacturing Company in 1892, over 21 years ago. There, he at once began to exhibit business traits that marked him out for success and promotion, so, naturally, when the firm became a limited liability concern, he was offered the position of secretary-treasurer, and to him a fair share of the firm's success is due.

As a citizen, Mr. Herrington has made his mark in anything in which he has taken an active interest. In the Anglican Church he holds the responsible position of Warden. In Masonic circles he is also prominent, having risen to the Master's Chair in Manito Lodge.

Being born in 1873 Mr. Herrington is still in the vigor of manhood, and his town has much yet to expect of him as well as his firm. He is popular, progressive and active in business and in citizenship.

Mr. W. F. Dennis

Mr. W. F. Dennis, superintendent of The Bryan Manufacturing Company, Limited, was born in Aberdeenshire, and served his apprenticeship in Bonnie Scotland. Being imbued with a desire to enlarge his experience, in 1893 he went to the United States where he spent

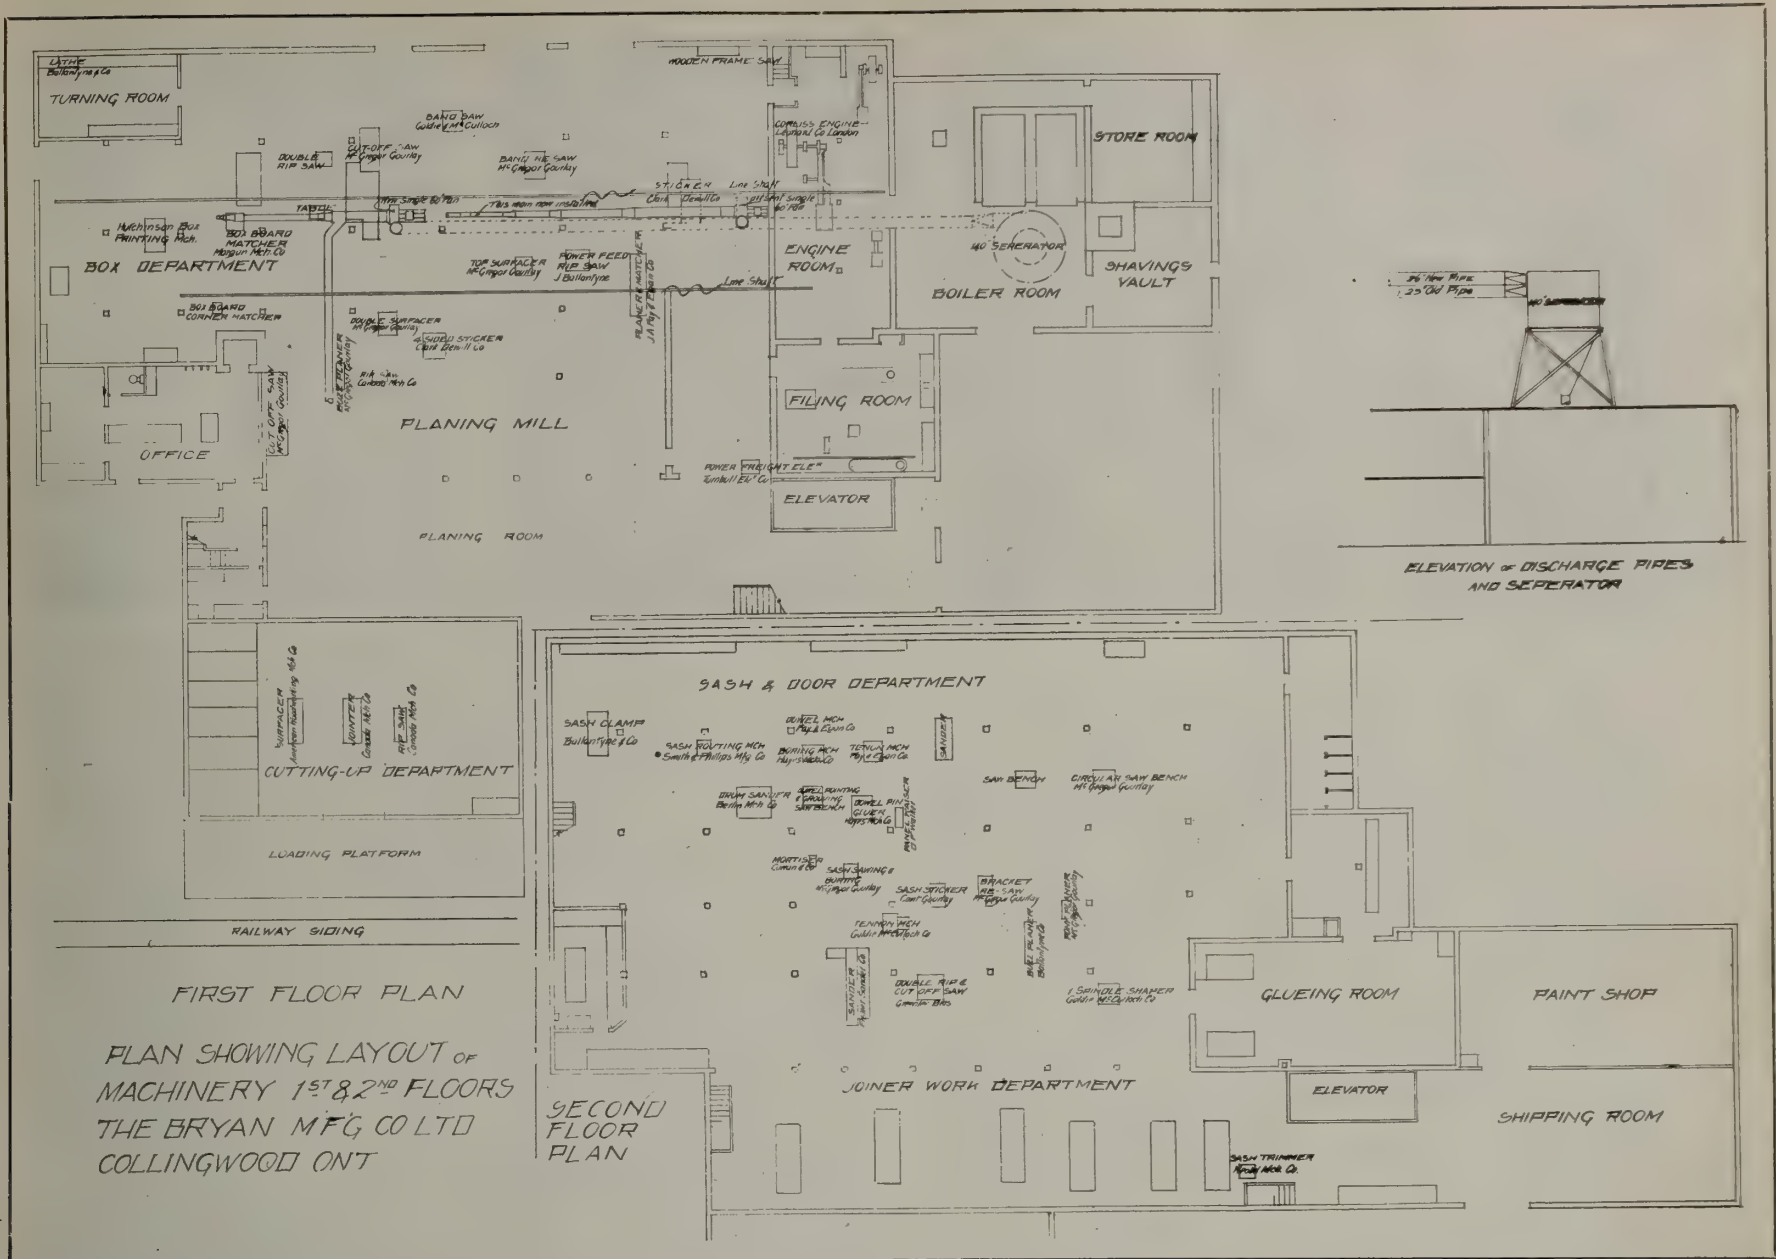

some time in the largest factories in Uncle Sam's domain. He then moved to Canada, and in 1905 he was offered and accepted his present

Dry Kilns at Wilson Bros., Limited, Collingwood.

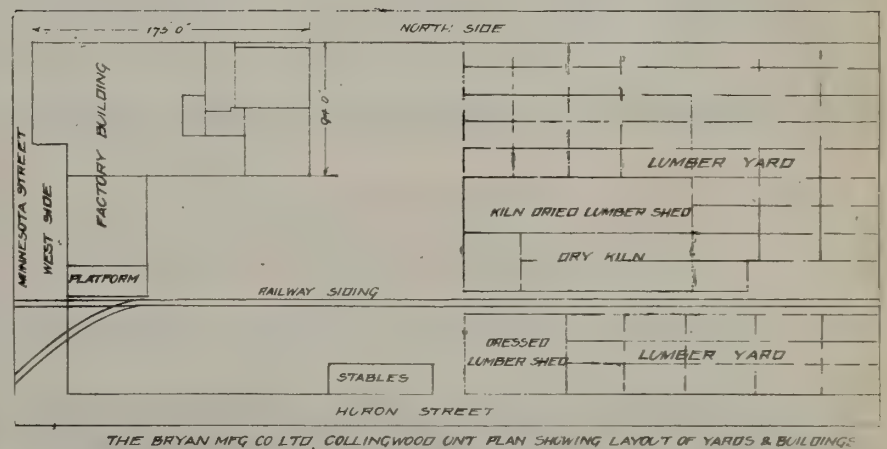

View in Joiner Department, Bryan Mfg. Co., Collingwood.

position. Mr. Dennis' practical experience in all branches of the trade now stood him in good stead, and having a thorough knowledge of all details it is needless to say that a large measure of the firm's success is due to his ability.

Wilson Brothers, Limited

One of the most important and successful industries in the town of Collingwood is that of Wilson Bros., Limited, who operate an extensive and splendidly equipped planing mill, located at the corner of First and Walnut Streets. Collingwood itself has made great strides in the industrial world during the last decade, with the result that building operations, both in the town and the surrounding district, have been upon a scale of great magnitude. The planing mill business has felt the benefit of this expansion and it was natural that those firms which were most efficiently equipped for handling the extensive building business would grow in a measure at least equal to the expansion

Kent, Cooper Lumber Company's Mill, Collingwood, Ont.

Charlton Sawmill Company's Mill, Collingwood, Ont.

of the industry itself. Wilson Bros., Limited, were already long established, when the period of expansion commenced and were in an enviable position to take advantage of the excellent business conditions prevailing. Their history during the last decade has been one of continual expansion and to-day they are operating a planing mill and general woodworking business, the equal of any in Canada. They make a specialty of the manufacture of hardwood flooring, which is favorably known all over Canada and Newfoundland. Their equipment includes everything essential to the manufacture of high-class sash, doors, frames and all interior finish. A specialty in this department being hardwood veneered doors made to detail. The plant handles about 4,000,000 feet of hardwoods and 2,000,000 feet of pine annually and their products are shipped to all parts of Canada.

In the year 1887 the present business of Wilson Bros., Limited, Collingwood, Ont., was established by Daniel and John Wilson, who commenced the operation of a general planing mill business on Hurontario Street. This firm continued in business until about ten years ago when Daniel Wilson and A. Matts formed a partnership to carry it on. In July, 1905, the firm was formed into a joint stock company with Daniel Wilson as president; A. Matts, vice-president, and H. A. Currie, secretary-treasurer. Subsequently Mr. Matts retired from the company and in 1910 Mr. Daniel Wilson died. Since then the company has continued with Mr. H. A. Currie as president and W. F. Wilson as secretary-treasurer.

As will be seen from the accompanying illustrations, the plant consists of a large main building, dry kilns, storage sheds, drying houses, power house, etc., covering in all about six acres or two city blocks. Since the incorporation of the company in 1905 the equipment and volume of business have grown to almost three times their original size. The planing mill is splendidly equipped with all the most modern woodworking machinery and facilities for the production of every description of mill work. The four dry kilns operated by the company, which were manufactured by Sheldons, of Galt, Ont., have a capacity of 250,000 feet. The power for the company's operations is produced entirely from the sawdust and shavings resulting from its manufacturing operations.

Mr. H. A. Currie the genial and well-known president of the company, whose portrait is published herewith, was born in 1858 at Lagmore in the township of Nottawasaga, about seven miles from Collingwood. He was educated at Collingwood in the public and high schools. His early business experience was obtained with the firm of Melville, Fair & Company for whom he acted as accountant and confidential man. He remained with that firm for seventeen years, during the last five of which he occupied the position of manager. Then, for a time, he became associated with the Northern Navigation Company, occupying a position of importance on one of their vessels. After this Mr. Currie settled in Collingwood and became associated with the firm of Wilson Bros., Limited. Since his connection with this firm it has

continued its wonderful progress and has become one of the foremost planing mill companies in Canada.

For three years Mr. Currie was honored by the citizens of Collingwood with the position of Mayor, which he filled to the thorough satisfaction of the people of Collingwood and to which he gave the benefit of his wide and successful business experience. To-day Mr. Currie is a member of the Water & Light Commission of Collingwood.

Mr. F. W. Wilson, secretary-treasurer of the company is a practical man of long experience and has always been connected with the lumber and woodworking business and his acquaintance with all its details is of the greatest value to the company.

The Charlton Sawmill Company, Limited

The Charlton Sawmill Company, Limited, Collingwood, Ont., of whose plant an illustration is published herewith, is one of the best known lumber manufacturing companies on the Georgian Bay. Mr. F. R. Roginson, of Collingwood and North Tonawanda, N.Y., is manager and secretary-treasurer of the company. The output of the plant this year will be about 12,000,000 feet of lumber and 4,000,000 pieces of lath. The business was established about 1899 by John and Thomas Charlton. To-day, Thomas Charlton, of North Tonawanda, N.Y., is president of the company, and is the owner jointly with the John Charlton estate.

The mill is equipped with two single cutting band mills, a lath mill, tub bottom and curtain pole making machinery, and the usual complement of edgers, trimmers, etc. Although the Charlton Sawmill Company owns no limits, its plant is kept well supplied with logs, which it cuts under contract for other firms. The tub bottoms, curtain poles, etc., are produced as a by-product from the lumber which the company manufactures under contract.

The Kent Cooper Company, Limited

The Kent, Cooper Lumber Company, Limited, Collingwood, Ont., manufacturers of lumber, have been intimately associated for many years with the growth of Collingwood. Their mill, an illustration of which is shown herewith, produces about 30,000 feet per day. It is equipped with an up-to-date circular mill, steam nigger, steam feed, canter, etc. At Dyers Bay in the Bruce peninsula, the company also operate a circular mill which produces about 15,000 feet per day. The officers of the company are:—Frank Kent, president, Meaford, Ont.; W. B. Seaman, director, Toronto; Robert Harmer, director, Toronto; D. G. Cooper and K. N. Cooper, directors, Collingwood. The present mill was built about three years ago.

The business was established in 1875 by Mr. D. C. Cooper. In addition to handling all kinds of hard and soft, rough and dressed lumber, Mr. Cooper is also an extensive retail dealer in coal and wood. The mill, yards and sheds are well equipped with every facility and convenience. They cover about eight acres, and are connected with switches from the G. T. R. giving excellent railway transportation facilities.

Development of a Remarkable Industry

Eight Years Only Between Modest Beginnings and the Erection of a Large Modern Plant—Benson & Bray, Limited, Midland, Ont.

THE romance of business is most interestingly illustrated in the story of the development and growth of the firm of Benson & Bray, Limited, Midland, Ont. Mr. Benson and Mr. Bray, who have for several years been in business under the firm name of Benson & Bray, were formerly in the building contracting business. In 1905, Mr. Benson concluded that he could save a good deal of expense by producing his own sash, frames, etc. After thinking the matter over he put up a little work shop on 6th Street where he commenced the manufacture of frames and sash, using a six horse-power gasoline engine for the production of power. Looking at this little business in the year 1905, no one would have suspected that in the year 1913 it would have developed into an enormous manufacturing plant, equipped with every modern type of machine for the production of sash, doors, and interior finish and costing over \$10,000. This, however, has been the case. The chief factors in the remarkable growth of the business have been the grit and determination of its founders coupled with the splendid opportunities presented by the location of the plant at Midland.

Early Days of Growth

The little work shop on 6th Street had not been in operation many months before it was found necessary to increase its capacity. At first the idea had only been to produce sash and frames for the contracting business which Messrs. Benson & Bray were carrying on. Soon, however, other people commenced to bring business to the little

work shop, in such quantities that they decided to abandon the contracting business and devote their whole attention to shop work. To do this a larger shop was required and for this purpose they secured a site 150 feet square on the corner of Third and Montreal Streets. Here they erected a building 36 feet x 50 feet, two storeys, and started in with the machines from the little work shop. This equipment consisted of an engine which was a six horse-power gasoline, a rip-saw, pany planer, turning lathe, bracket band-saw, jointer, elbow arm sander and foot power mortiser.

On July 1st, 1907, they produced the first piece of work made in the new factory. Here the business continued to grow. The gasoline engine was shortly replaced by a 50 horse-power steam plant and further increase in capacity was necessitated. New machines were continually added and each year a large addition was made to the original building. Every year they more than doubled their number of employees and volume of business, until, at the close of the year 1911, the new property, which they had expected would suffice for a long time, become so entirely occupied with buildings that further expansion was impossible. During the early part of 1912 options were secured on their present site so advantageously and beautifully situated close by and overlooking the harbor, upon which their extensive and modern plant has been erected.

Messrs. Benson and Bray then decided to ask for some assistance from the town of Midland, to enable them to erect a new factory,

Jas. A. Benson, Midland, Ont.

Dwight J. Turner, Midland and Toronto.

M. J. Bray, Midland, Ont.

C. M. Tremere, Midland, Ont.

and on April 12th a by-law, granting them a loan of \$25,000, was voted on and passed unanimously, being good evidence that the people with whom Benson & Bray had been doing business, had confidence in them and were willing to help in the extension of their business.

Plans for the new plant and equipment were then prepared and to secure sufficient capital to carry out these plans it was decided to form a joint stock company to be known as Benson & Bray, Limited.

The officers of the company are: James A. Benson, president; Midland; Dwight J. Turner, vice-president, Toronto; M. J. Bray, treasurer, Midland; C. M. Tremere, secretary, Midland.

Mr. Turner, who is also president of the Turner Lumber Company, of Toronto, which is well known by leading wholesale lumbermen throughout Canada and the United States, has been actively associated with the lumber business all his life. His wide experience together with unusual business acumen will, we are sure, be of inestimable value to the new company.

Mr. Tremere, who is also secretary-treasurer of the Freeman Lumber Company, Limited, has had a long experience in the lumber and planing mill business, having for years been actively engaged in the manufacturing and selling departments of one of the leading manufacturing plants in Ontario.

With the assistance and co-operation of these two gentlemen the firm of Benson & Bray, Limited, comprises a personnel, all actively engaged, that will undoubtedly ensure the success of the enterprise.

An Evidence of Progress and Enterprise

The plant as it stands to-day is interesting evidence of the energetic methods adopted by Benson & Bray, Limited, in all their business dealings. Building operations were commenced on the new site on June 12th, 1912, and the plant was opened on March 26th, 1913. Over \$120,000 has been invested and everything has been planned upon a scale which will enable the company to turn out a great variety of planing mill products at the smallest possible cost and of a quality which cannot be excelled to-day.

The fine new building is shown in one of the accompanying illustrations. It has been designed on a generous scale, providing ample room and light for successful operation. The building is of brick and concrete, slow burning mill construction, two storeys high. It is 240 feet long x 74 feet wide. The mill proper is 200 feet long and two storeys high. The boiler room and shavings vault are one storey which is seen at the farther end of the illustration. The boiler room is 40 feet square, having a ceiling 25 feet high, which is composed entirely of reinforced concrete having a span of 40 feet each way without central support. The boilers are equipped with Dutch ovens and the floor of the shavings vault is level with the top of these, thereby greatly facilitating the firing of the furnaces.

The first floor throughout the plant is of concrete—a feature of utmost importance as it ensures perfect rigidity and the vibration of all the heavier machines is not transmitted to the building. It also makes an ideal floor for the handling of lumber on trucks.

The building is heated by the Durham vacuum system of steam heating having sufficient radiation to ensure a comfortable temperature under severest weather conditions. It is equipped with the finest fire protection facilities; a complete Grinnell Automatic Sprinkler System installed by the General Fire Extinguisher Company, as well as fire bucket tanks, etc.

An excellent freight elevator, furnished by the Roelfson Elevator Company, Galt, Ont., having a platform 18 feet long x 7 feet wide, and a carrying capacity of 2 tons, which has been installed, enables the company to transfer stock, etc., from one floor to the other rapidly and economically.

The Power and Transmission Equipment

One of the most important features of the plant is the equipment for the production and transmission of power which has been worked out on a most economical and efficient basis and which makes use of the shavings and sawdust for fuel. This refuse is collected from the machines and delivered to the shavings vault by a double 55 slow

Wheelock Engine 20' x 46"—Benson & Bray, Midland, Ont.

Boiler Room and Shavings Vault—Benson & Bray, Midland, Ont.

New Plant of Benson & Bray, Midland, Ont

speed Sturtevant fan, by means of an elaborate system of piping. Steam is generated in two large return tubular boilers, for the engine, which is a Wheelock automatic of 350 horse-power; an interesting comparison with the original 6 horse-power gasoline with which the firm was producing its power six years ago. Boilers and engine were manufactured by the Goldie & McCulloch Company, Limited, Galt.

After generating power in the engine, the steam is used for heating the building and dry kilns which are constructed on the moist air system and were furnished by the A. H. Andrews Company of Chicago. Power is transmitted from engine to line shafting and thence to the machines by means of belts. All line shafting is of large diameter and equipped with Chapman Double Ball Bearings every 8 feet.

The planing mill equipment in the plant of Benson & Bray, Limited, is the most modern of its kind that could be obtained. On the lower floor it includes an S. A. Woods No. 401 fast feed matcher, equipped with automatic feeding table, taking stock at 200 feet per minute, an inside moulder No. 107B, made by the same firm, equipped with profile joining attachments, making mouldings at 100 feet per minute; Cowan moulder 13-inch, 4 side; Balantine 4-side moulder; Berlin double surfer, No. 177; Berlin band resaw, No. 289; rip and cut-off saws, etc., all of these machines having large capacity, enabling the company to handle an enormous amount of work in a short time.

Upstairs there is full equipment for the manufacture of doors and sash, made by the E. B. Hayes Company, Oshkosh, Wis.; Berlin triple drum sander, Mattison belt sander, Buss shaper, No. 8; Whitney cabinet planer, etc., making a total of 30 machines.

Excellent Shipping Facilities

The facilities of the company for receiving and shipping goods are as complete as possible. Railway sidings are located at each side of the plant. Stock comes in at one side and the lumber is passed through the machines and comes out ready for loading on the empty cars on the other side of the building.

The product of the plant consists of solid and veneered doors, sash, mouldings, flooring and all high grade planing mill products.

View on First Floor—Benson & Bray, Midland, Ont.

View on First Floor—Benson & Bray, Midland, Ont.

In addition to this the company make a specialty of working lumber in car lots, for which they have excellent facilities being in a position to handle four cars at once.

The offices of the company are located on the ground floor of the main building.

The comfort and convenience of the employees of the company have been specially considered, not only with a view to pleasing the workmen but also in order to enable them to produce the best possible work. Their working quarters are bright and airy with lofty ceilings and are among the most inviting of their kind to be found in Canada. Further consideration of the interests of the employees has been given by the installation of modern plumbing, drinking fountains, etc.

From the above description and the accompanying illustrations, readers of "The Canada Lumberman" will obtain a fair impression of the manner in which the firm of Benson & Bray, Limited, carry out all their business undertakings. It is reasonable to expect that a company with such excellent equipment and energetic methods will continue to occupy a foremost place in the planing mill industry of Canada and that, with the growth of the district which they serve and the general development of the country, they will, in the future, find it necessary to make even further additions to the excellent plant which they are now operating.

Approximately 70,000,000 feet of Douglas fir, red cedar, and western hemlock, and 286,000 feet of cedar poles are offered for sale by the United States Government to the highest bidder, who will be given five years in which to cut and remove the timber from the Olympia National Forest, State of Washington. Stumpage prices may be readjusted by the chief forester in 1916 if lumber prices obtaining then warrant it. On one lot of the Douglas fir no price less than \$1.65 will be considered, while on the second block \$1.80 will be the minimum.

White Pine Door Department—Benson & Bray, Midland, Ont.

Extensive Importers of Mahogany

Robert Bury & Co., Bring Stock of Valuable Lumber to
Toronto—Dealing in Canadian and U.S. Hardwoods

An interesting stock of mahogany lumber imported into Toronto by Robert Bury & Company, Limited, Liverpool, England, is shown in one of the accompanying illustrations. The connection of the firm of Robert Bury & Company with the Canadian trade is of much interest. They originally handled Canadian maple mangle roller blocks. These were shipped by the late Mr. W. R. Thompson, of Teeswater, Ont., and latterly by Mr. F. M. Thompson. In January, 1912, on account of the remarkable expansion of the firm of Robert Bury & Company, it was decided to transfer their Canadian quarters from Teeswater to Toronto and to open up a yard and do a local trade at Toronto. The location of the yard is on the Bay Front a little east of the foot of Spadina Avenue, and the Company's office is located at 79 Spadina Avenue at the corner of King Street. The Toronto branch is being managed jointly by Mr. F. M. Thompson, late of Teeswater, and Mr. R. Buchan, the firm's late London manager.

The company deal extensively in Canadian and United States hardwoods and recently decided to go in for the mahogany importing business. Realising the importance of the demand in Canada for high-grade mahogany they have made a speciality of importing good stocks with attractive figure. The stock shown in the accompanying illustration is a carload of exceptionally fine grade British West African (Benin) mahogany shipped by their head office at Liverpool. An examination of the illustration will show the very careful method in which the stocks are piled. An examination of the pile itself would show that the hearts and poor ends of the logs have been held back by the company in the old country. Owing to the excellent facilities which they have for handling this wood they are enabled to dispose of the hearts and poor ends in England and send to Canada only the high-grade stock. The result is that the Toronto stocks of the company contain only highly figured and richly coloured wood. In the old country the company dispose of the poorer grades of mahogany to the manufacturers of cheap furniture.

An Old-Established Firm

The firm of Robert Bury & Company have been in business for about twenty years. Their London branch is located at 27, Great Tower Street, London, E.C. The head of the company is Mr. Robert Bury, of Liverpool. The head office in addition to importing Canadian stock are now handling American hardwoods extensively, the Toronto office acting as their buying agents throughout the United States and Canada. Not only do they import on their own account but they carry on a general wood broker's and wholesale dealer's business. The company's Canadian shipments, of which they make a speciality have a splendid reputation in the markets of London, Liverpool and Manchester.

The Toronto office of Robert Bury & Company makes a speciality of supplying stocks for the piano, furniture and other similar trades handling hardwoods. They continually carry a fine variety of stock in their yards at Toronto and always keep on hand about half a million feet of maple, basswood, elm, etc., at country points.

One of the accompanying illustrations shows some stock recently purchased by Robert Bury & Company, being from three-quarters, to one million feet of specially good quality winter sawn basswood, mostly 1-in. thick with a little 1¼-in. It is a rare thing in this age to get so large a quantity of winter sawn basswood in one block (none of the stock having been in the water) although this is partly

Handsome Ocean Wave Mahogany—Robert Bury & Co., London England and Toronto, Ont.

explained by the fact that the firm had to go thirty miles back from the railway for this choice virgin stock. This block will be relay-hauled next winter as soon as sleighing arrives.

The third illustration shows a specimen of figured mahogany handled by Robert Bury & Company's London office. It is of the variety known as the ocean wave figure, and is sold by them to the piano trade for manufacturing into high-class veneers.

Russian Wood Pulp Must Pay U. S. Duty

Secretary McAdoo has announced that wood pulp and paper would not be admitted free of duty from Russia under "most favored nation" treatment, the treaty of commerce and navigation between the United States and Russia having been abrogated. The Customs Court recently decided that European countries with favored nation treaties with the United States were entitled to free wood pulp and paper because that provision was granted to Canada. The Treasury Department has accepted that principle, but for the time being will apply it only to Norway, Austria-Hungary and Germany, which, aside from Russia, were the only countries directly involved in the decision. Secretary McAdoo has asked Secretary Bryan to ascertain whether Sweden, Belgium, Finland, Newfoundland, England and Denmark are entitled to free entry by virtue of their treaty rights. Wood pulp and paper come from all these countries, but as they were not specifically mentioned by the court the State Department is asked to decide whether they come within the purview of the decision. In view of the abrogation on December 31 last of the treaty of 1832 with Russia, wood pulp and paper importations from that country since that time will be assessed for duty.

The officers of the battleship New Zealand were recently entertained at Fraser Mills, B.C., by the Canadian Western Lumber Company, who conducted them through their large mills and showed them the process of converting huge logs into finished lumber.

Pioneer Industry at Penetanguishene

Growth of an Extensive Manufacturing Business From a Sawmill of 40 Years Ago—The C. Beck Manufacturing Co's. Modern Plant

In the early seventies of the last century, Mr. C. Beck, founder of the C. Beck Manufacturing Company, Limited, Penetanguishene, Ont., arrived at Penetang and commenced operating a saw mill. From this beginning the present extensive manufacturing industry of the company took its origin. The mill operated by Mr. Beck in these days, was burnt about 1880 and then a new mill was erected which was known in its day all over the Georgian Bay district as "The Big Mill." The same mill is in operation to-day and is shown in the foreground of the accompanying panoramic view of the company's plants. Penetanguishene has been an important lumber manufacturing centre for long years. Not only was Mr. Beck to be found operating there in the early days, but another mill was operated by a man from Keene, New Hampshire. This mill was bought in 1887 by Mr. Beck and was operated by him until the spring of 1912 when it was destroyed by fire. It has now been replaced by the thoroughly modern and extensively equipped mill shown in one of the accompanying illustrations.

Growth of a Varied Industry

The present business of the C. Beck Manufacturing Company is the result of many years' growth. The original saw milling operations have been increased from time to time and other branches of industry have been added until to-day the company manufacture not only lumber but many classes of products for which lumber is the raw material. These include particularly pails, tubs and boxes in which they are enabled to use up materials produced by their other mills which would otherwise go to waste or have to be sold at a great sacrifice. In addition to the plants at Penetanguishene the company also operate a modern box making plant at Toronto. The pail and tub plants at Penetanguishene were established in 1904.

At one time the C. Beck Manufacturing Company also operated a mill at Savanne on the C. P. R. west of Port Arthur turning out at that point about 80,000 feet of lumber per day. This mill however, was disposed of some years ago.

The most interesting part of the plant at Penetanguishene is the new mill, taking the place of the one which was destroyed by fire last year. This mill is equipped practically throughout with Waterous machinery, including a double cutting 8 ft. L.H. band mill, 42 in. opening cast steel carriage with steam set work 10 in. x 42 ft. gunshot

feed, steam log kicker, log loader, and nigger, 48 in. Big Champion engine with cluster collar, also conveyors, live rolls, drives, etc. The mill also contains a gang edger, Payette independent bolter and lath mill, etc. This lath equipment is similar to the equipment in their other mill, on which they made a record cut of 128,000 pieces in ten hours. It is estimated that the capacity of the new mill will be about 70,000 ft. in a ten-hour day. Above the floor on which is located the sawing equipment of the mill, the filing room is placed. Splendid light has been obtained for this work and plenty of space, so that the filers are able to secure results which would not otherwise be possible.

The mill building is constructed of timber covered with corrugated iron sheeting. It is 120 ft. x 30 ft. and the lath mill is 50 ft. x 30 ft.

Splendid facilities have been secured for booming purposes. The company is able to hold 3,000,000 feet of logs in its booms at the mill.

Conduct All Their Own Operations

A specially interesting feature in connection with the C. Beck Manufacturing Company, is the fact that the company carry on a number of additional manufacturing operations, outside of the production of lumber, which enables them to reduce to a minimum the quantity of material going to waste. In connection with the new mill they have installed a Mereen-Johnson slab resaw for making heading and shook stock. This will be operated entirely upon slabs and cut-offs.

The Penetang saw mill shown in the foreground of the accompanying illustration has a capacity of 80,000 feet in a ten-hour day. Its equipment consists of a circular and a Wickes gang, together with Payette independent bolter and lath mill.

The box and shook factory operated by the company together with the pail and tub factory make up the equipment for the use of material which would otherwise go to waste. These plants are equipped with the latest type of machinery for the various processes required. The company also carry on a profitable business in planing-in-transit. They have installed a new fast feed Berlin matcher for this work, located in the box factory.

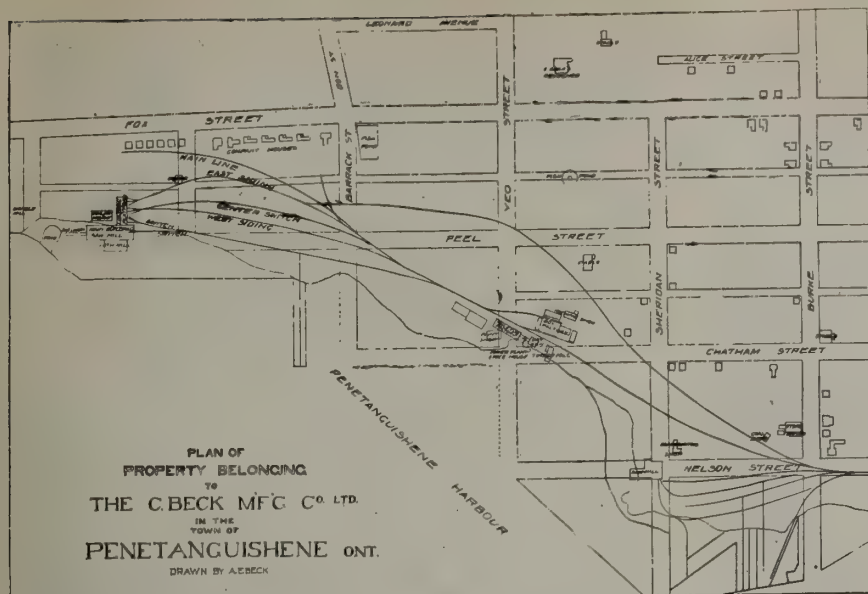

The woods operations of the C. Beck Manufacturing Company have always been on an extensive and interesting scale. At present they are just completing an operation in Creelman township north of

New Mill of C. Beck Mfg. Co., Penetanguishene, Ont., view showing log haul-up.

New Mill of C. Beck Mfg. Co., Penetanguishene, Ont., view showing sorting table.

Sudbury, in which they have been raiing their logs to Parry Sound and towing them from there to Pentanguishene. The extent and completeness of the whole industry of the company can be appreciated when one considers that they own their own timber, operate their own camps, rail their own logs, have their own engines and sidings, tow their own logs in their own booms, up to last year owned their own freight vessel carrying lumber to Tonawanda, Detroit, etc., and conduct also, all their sawing and selling operations under their own personal attention.

Opening New Timber Limits

In their new woods operations the company are now entering a new limit near Thessalon, Ont., containing red and white pine and a small quantity of spruce. Upon their various limits they still own sufficient timber to keep their industry operating for many years to come.

The company have splendid facilities at Penetanguishene for handling stocks both by rail and water. Their annual cut amounts to 15,000,000 or 16,000,000 feet of lumber and about 12,000,000 pieces of lath. The company also operate a shingle mill, but at the present time on account of the scarcity of shingle bolts it is not being operated. They employ over 250 men in their various operations at Pentanguishene. The men employed upon the boats would bring this total up to about 275. The new mill, referred to above, commenced operations about the 1st of August. Construction work upon this mill was commenced last Fall.

Mr. C. Beck the well-known founder of the C. Beck Manufacturing Company was born in Germany and came to Canada at an early age. For a time he worked at carpentering, saw milling, etc., and subsequently moved to Penetanguishene and went into the saw milling business. His ability and integrity are recognised by all who have come into contact with him in a business or personal manner. The people of Penetanguishene have given evidence of their appreciation of Mr. Beck's presence among them by electing him for a number of years to the position of Mayor. His son, Mr. W. F. Beck, who is now in charge of the operations at Penetanguishene is following in his father's footsteps and taking an important part in the public life of the town. He is at present a member of the town council and President of the Board of Trade.

Mr. A. E. Beck another son of Mr. C. Beck, has been, for some time, in charge of the woods operations of the company. His headquarters were formerly at Sudbury but were recently moved to Thessalon in connection with the new operation being conducted by the company in that district.

The Slack Barrel of the Future

By James Innes

During the past year, millers, coopers, etc., have viewed with alarm the increasing scarcity of elm timber available for staves and hoops, and basswood for heading. For the past twenty-five years, these have been the favorite woods for flour, sugar, apple, salt and other slack barrels in Canada, and consumers have the idea that other woods are not suitable.

Twenty years ago, millers in Ohio thought that Basswood staves were the thing. In Minneapolis, red oak staves were used exclusively, and it was only by hard plugging and practical demonstration that elm staves were introduced, and made the staple article. Now the large consumers in the United States use beech, birch, maple and gum for sugar barrels almost entirely. The millers use birch, gum and elm when they can get it. Last winter and spring gum staves were used extensively in Canada, for flour and salt barrels. Mill-run hardwood staves, beech, birch and maple have been used for some time here, when No. 1 elm staves could not be obtained, and birch staves to some extent for sugar and flour barrels.

Birch the Future Stave Wood

There is no question that the wood of the future, for staves in Canada will be birch. It makes a better stave than gum. Millers in Minneapolis give birch the preference over gum and pay a higher price for birch staves than for any others except elm. When properly manufactured by the latest machinery and jointed carefully at the proper time, birch staves make an excellent barrel. One of the largest sugar refinery managers expresses the opinion that he has no preference for elm over birch. As there are large quantities of this timber in northern Ontario, it can be safely assumed that the stave business in Canada is not going to decline for lack of raw material, for many years.

What elm there is left in the country should be reserved for hoops. By a careful husbanding of the available elm there should be enough to make hoops for years to come.

Regarding heading timber,—Basswood is practically a thing of the past, but birch and maple make an excellent head for the higher grade barrels, while there is an immense amount of spruce and balsam in the north country obtainable for heading, for apple, salt, cement and other barrels not requiring fancy heading.

The export demand is for hardwood heading. Basswood is classed as a soft wood, and is not worth within a half a cent per set as much as hardwood heading for British consumption.

Future Cooperage Materials

I may therefore safely say that the barrel of the future in Canada will be made from birch staves, birch, maple, spruce, or balsam heading, elm hoops for a time, but eventually iron hoops.

As the barrel is the oldest container we have any track of in history, and as it is the most convenient, strongest and cheapest, package taken altogether, both manufacturers and consumers are anxious to conserve suitable timbers as much as possible, and the government should help, and see that these timbers are not wasted, either by careless cutting or by fire.

An Important Georgian Bay Saw Mill

Outline of Lumbering Operations at Waubaushene, Ont.—W. J. Sheppard's
Long Connection With the Industry at This Point

The town of Waubaushene, Ont., is in the centre of one of the most important lumber producing sections of the Georgian Bay district and has, for over a century, been noted as the location of one of the largest and best equipped mills operating in that important lumbering district. In the year 1860 Mr. Wm. Hall built the first mill at Waubaushene. An interesting illustration of this mill, is published herewith, being reproduced from an old cut, kindly furnished by Mr. W. J. Sheppard the well-known president of the Georgian Bay Lumber Company. The illustration shows the mill practically as it was in those days, with the exception that the smoke stack shown on the left was an addition put on some years later.

In 1869 the mill was bought from Mr. Hall by the Georgian Bay Lumber Company, who operated it for some years under this name and later under the name of the Georgian Bay Consolidated Lumber Company, which included mills at Collingwood, Byng Inlet, Port Severn and Waubaushene. The latter company continued in operation from 1881 until about 1893, after which the Georgian Bay Lumber Company again came into existence.

The present members of the company are as follows:—W. J. Sheppard, president, Waubaushene; M. J. Dodge, vice-president, New York; C. P. Stocking, secretary-treasurer, Waubaushene; C. H. Sheppard, superintendent, Waubaushene; directors, Messrs. A. M. Dodge and M. J. Dodge, New York; H. L. Lovering, Coldwater; W. H. L. Russell, Waubaushene.

Equipment of the Mill

The present saw mill of the Georgian Bay Lumber Company is widely known as one of the most efficient in Ontario. It is equipped with two gangs, twin circular, two other circulars, one single cutting band saw, one band re-saw, two edgers, two trimmers and lath and picket machines; practically all of the equipment having been furnished by the Wm. Hamilton Company, Peterboro, Ont. One of the circular saws is used for cutting bill timber and the other for manufacturing small logs in connection with a band re-saw which is operated behind it. The mill has a capacity of about 200,000 feet in a ten-hour day, and is operated entirely on red and white pine. The products of the plant are sold in Ontario, the United States, South America and England. The upper grades are disposed of largely in England, the intermediate and lower grades going to Canada and United States. The limits of the company are extensive and contain a large quantity of high-grade timber, being located in Algoma, Muskoka, and on the Dokis Indian Reserve. At present the company have about 150,000,000 feet of standing timber on their limits, sufficient to keep their mill in operation for about six years. In their woods operations the company cut on an average about 25,000,000 feet annually.

The sawmill of the company is constructed of wood covered with iron. The boiler house and engine room are separated from the mill by a brick wall. One of the most noticeable features in connection with the plant is the scrupulous cleanliness prevailing throughout. The mill and the yards, as well as the log pond and everything in connection with the plant has the appearance of having been sub-

W. J. Sheppard — Waubaushene, Ont.

jected to a thorough house-cleaning about five minutes before the arrival of anyone who pays it a visit. Needless to say this is a feature which presents itself most favorably to the insurance companies with which the company carries its policies.

Perseverance and Ability Bring Success

Mr. W. J. Sheppard, the president of the company, whose portrait is reproduced herewith, is one of the best known lumbermen in Ontario. He has made his way to the top of the ladder, by sheer business ability and energy. He was born at Keswick on Lake Simcoe in 1852 and obtained a public school education during the winter months, as during the rest of the year he was busy earning a living. His parents owned a farm at Keswick, having come to Canada from the Eastern States and settled in the Lake Simcoe district. On his mother's side Mr. Sheppard is a descendant of the well-known Sprague family. His father came to Canada from Ireland as a young man.

Mr. W. J. Sheppard's first business experience in connection with the Georgian Bay Lumber Company was in the position of store-keeper which he assumed in 1870. This position he occupied during

The First Mill at Waubaushene—One of the earliest on the Georgian Bay

the summer. During the winter he was engaged in measuring logs. At that time he was eighteen years of age. His first position as log measurer was at the camp on the Coldwater Road between Orillia and Waubaushene. The summer time again found him running the store. Shortly afterwards, he moved to Gravenhurst as superintendent of the company's bush work. Then he was moved back to Coldwater on the same kind of work. In the Coldwater camp the company turned Mr. Sheppard's progress with the company has been steady and sure. Today he is looked upon as one of the most widely experienced

lumbermen in the Georgian Bay district. His success is an inspiration to all who are engaged in the lumbering business, showing, as it does, that ability and application will bring about success as surely in this line of business as in any other. In spite of his success Mr. Sheppard is a man of retiring disposition. Every week day, with the exception of Fridays, finds him busily engaged looking after his company's interests at Waubashene. He gives personal attention to all details,

and although he has been at this work for so long a period and has reached a position in which many other men would be content to delegate their duties to others, Mr. Sheppard still takes a keen delight in giving personal attention to the numerous details connected with the management of the business. Once a week, on Friday, Mr. Sheppard is to be found in Toronto, attending a meeting of the Royal Bank, of which he is one of the most valued directors.

Important Developments at Whitney, Ont.

Dennis Canadian Company Operating Two Mills—Logging Railroad Used to Bring Hardwoods—Chemical Plant to be Established

AMONG the new lumber manufacturing companies which have commenced operations in Ontario during the past year, one of the most important is the Dennis Canadian Company, whose headquarters are at Whitney, on the Ottawa division of the Grand Trunk Railway. The Dennis Canadian Company is a Michigan corporation, its officers and most of its stockholders being Grand Rapids people. The president of the company is Mr. A. L. Dennis, who is also president of the A. L. Dennis Salt & Lumber Co., a very successful hardwood lumbering concern that has been manufacturing in Michigan for the past ten or twelve years.

The company was organized last September for the purpose of taking over and operating the timber limits of Cameron & Company, of Ottawa, on which an option had been secured and the transfer was made on the first of October last. This property consisted of about 150,000 acres of timber limits, a sawmill, lumbering equipment and other personal property used in connection with the operation. The sawmill is situated on Bark Lake, about thirty miles from Whitney, the logs being taken to the mill by water and the lumber delivered to the Grand Trunk over a siding $3\frac{1}{2}$ miles from Whitney, the logs being taken to the mill by water and the lumber delivered to the Grand Trunk over a siding $3\frac{1}{2}$ miles long. The mill is equipped with circular saw and re-saw and is being run on hemlock, spruce and pine. It can be run for many years on floatable timber from the limits tributary to the waters emptying into Bark Lake.

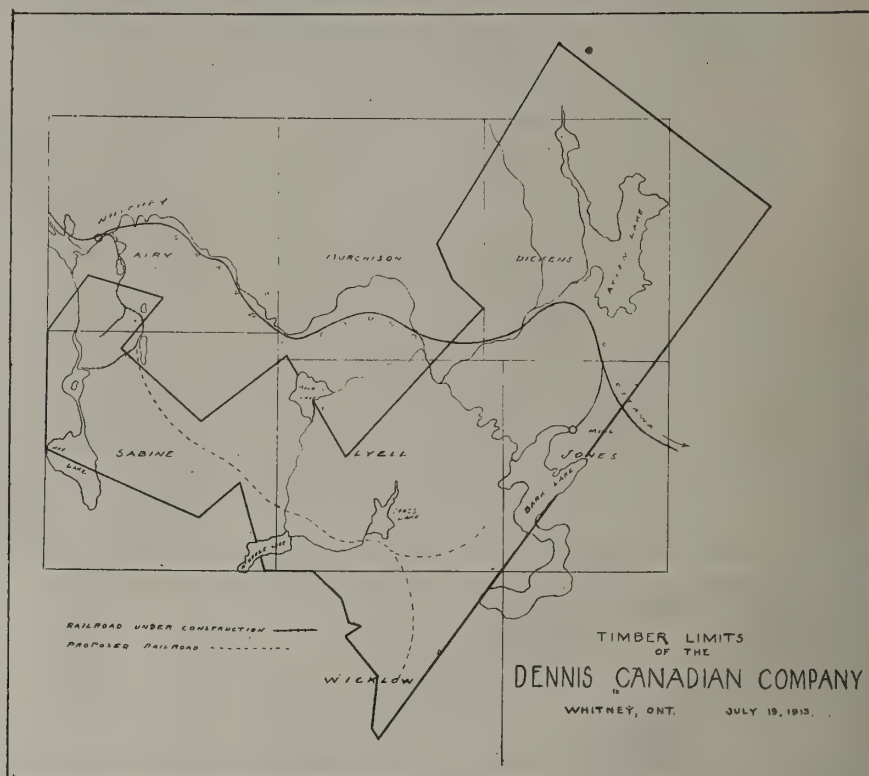

One of the Best Mills in Ontario

At Whitney is located the sawmill formerly belonging to the Munn Lumber Company, who had sold the timber on their limits to the government, as a large part of it was within the limits of the Algonquin National Park. This mill the Dennis Canadian Company purchased and they secured also a twenty-five year lease from the government, of the village location and all the buildings connected therewith. The mill is one of the best in Ontario. It is equipped with three band saws and re-saw and driven by a 750 horse power Corliss engine. The mill is remarkably roomy and well constructed, with brick power house, and has a record of running an entire season night and day with less than one hour lost time. It has a well-equipped machine shop, electric lighting plant, sprinkler fire system and is a thoroughly up-to-date plant. Owing to the late start on lumbering operations last fall, only a partial cut was secured for this season.

The limits of the Dennis Canadian Company are well timbered excepting a belt along the line of the Grand Trunk between Bark Lake and Aylen Lake, which was at one time heavily timbered with pine and is now barren.

Building a Logging Railroad

A large portion of the timber being hardwood makes it necessary to adopt some method of lumbering other than floating down the streams, as has heretofore been done. For this reason, a logging railroad is under construction from Whitney which will eventually extend about twenty-five miles southeasterly from that point. Eight miles

of road, six of main line and two branches of about one mile each, are at present under construction and will be completed this season. Then the line will be extended from year to year as necessary to secure the log supply for the mill.

The track being constructed is of standard gauge and 56-lb. steel is being used. The main line is being put up in shape to make a first-class road bed, but not so much expense will be made on the branches. The first two miles of road out from Whitney are through a very rough country and a good deal of rock had to be moved, but after striking the timber limits, which are reached $2\frac{1}{2}$ miles from the mill, the country is very favorable for railroad building and lumbering.

The railroad equipment has not been delivered as yet excepting a few flat cars and one 50-ton Shay geared locomotive. A second locomotive, steam log loaders and logging cars will be added before the beginning of log hauling in November. It is intended to keep the mill running throughout the year, cutting as largely as possible on hardwood in the winter and on softwood during the summer. The soft wood from about ten thousand acres can be landed on Hay Lake during the winter and driven to the mill with very little cost for driving.

This is one of the first attempts that has been made in Ontario to use the logging railroad for the purpose of taking out hardwood

View of Sawmill—Dennis Canadian Company, Whitney, Ont.

The Sorting Platform—Dennis Canadian Company, Whitney, Ont.

Plenty of Good Stocks—Dennis Canadian Company, Whitney, Ont.

for any considerable distance, but the methods being adopted are the same as have been successfully employed in many of the States for years and some such means will have to be used to reach the bodies of hardwood at a distance from the railroads, where the pine has been floated down the streams. The hardwood in this district runs very

largely to birch of fine quality, with a considerable quantity of good basswood, but the maple is not of a first class quality.

In order to utilize the enormous quantity of timber left on the lands after the removal of the sawlogs and which is fit for cordwood, an agreement has been made with the Standard Chemical Iron and Lumber Company, of Toronto, whereby the Chemical Company will erect within the coming year a large plant for the manufacture of charcoal, wood alcohol and by-products, using all the refuse from the sawmill for fuel and getting their cordwood from the limits on a stumpage basis. They intend to cut thirty thousand cords of wood during the coming season which they will load on the cars of the lumber company for delivery to the factory yard. The erection of this factory with the necessary cottages for the workmen and the wood cutting operations will mean a large increase in the amount of business and labor activity at Whitney.

A shingle and tie mill is now being erected to care for the cedar timber on the limits, and will soon be in operation. A large stock of cedar was put in with the other timber last winter and sorted into separate booms to await the erection of the shingle mill.

A general store is run in connection with the operations and does a very large business under the management of O. E. Post. The management of the business is in the hands of L. VanMeter, who was superintendent of the A. L. Dennis Salt & Lumber Company's operations in Michigan for eight years and the woods operations are under charge of I. A. Mateer, who filled a like position for the same company. These two, with D. L. Steven, the book-keeper, are the only Michigan men on the job, the balance of the operating force being made up of Canadians.

Hocken Lumber Co.'s Steady Growth

Otter Lake Company Now Operating Three Mills—Winter Mill Started Last Season—Specialists in Hemlock

Steady and continued progress has marked the operations of the Hocken Lumber Company, Limited, at Otter Lake in the Parry Sound district. Starting with one mill at Otter Lake Station, their trade has steadily grown until at the present time three mills in that vicinity are necessary in order to keep up with their business.

Last season, a winter mill which runs day and night right through the winter, was built five miles east of Otter Lake on the G. T. R. This mill while only having a circular saw equipment has an abundance of power capable of developing up to 120 h.p. At this point is also installed a fast feed Berlin planer to take care of their sizing trade, all hemlock being dressed and sized from the saw. The mill is surrounded by very choice hemlock timber, in the manufacture of which the company specialize and by supplying the mills with logs direct from the stump, they are in a position to fill the wants of the trade in square timber and bill stuff up to 40 feet in length at the shortest notice.

Following the timber trade still further, in order to take care of special orders, the company have recently opened a third mill at Horseshoe Lake, five miles south of Otter Lake on the C. N. R. and C. P. R. This lake is six miles long and the company have large holdings of hemlock bordering its shores.

The company's original mill at Otter Lake Station has had many additions made to it during the past several years. It is fitted with up-to-date machinery which is backed up with abundance of power.

Drawing on the Ice—Hocken Lumber Company's Winter Operations

The timber loading operations are facilitated by a steam hoist which picks up the square timber as it comes from the mill on live rollers and places it directly on the cars. The planing mill has been enlarged to take care of dressing-in-transit and recently a new fast feed Berlin planer has been installed.

Montreal Company Shares in Progress

Damien Lalonde Limited Find Increasing Business Necessitates Greater Capacity—Their New Plant and its Modern Equipment

250 h.p. Engine and 1000 gal. Pump

ed liability company, with the title of Damien Lalonde, Limited, the capital being \$200,000. The officers are Messrs. Damien Lalonde, president; Armand Lalonde, vice-president; Alphonse Lalonde, secretary-treasurer; Adrien Lalonde and L. Lionais, directors. In addition to manufacturing windows, doors, sash and general woodwork, the company are carrying on a retail lumber and contracting business.

Details of the Mill Construction

The new factory, designed by Mr. L. Lionais, is of first class mill construction, and admirably planned for economical production. The ground belonging to the company comprises over 100,000 square feet south of the C. P. R. track and 20,000 on the north side. The mill occupies a site 155 x 90, being lighted on all four sides. It consists of the ground floor and a first storey, and is equipped with some of the latest machinery and apparatus. The office, on the ground floor, is a very large room, fitted with furniture made in the factory, from gum lumber. Adjoining is a stock room, and on a lower level the boiler room. Here are two Goldie and McCulloch boilers, with a 250 h.p. steam engine constructed on the Jerome Wheelock system, and supplied by the same company. The boilers are automatically fed by shavings, which are collected from each machine in the mill by means of the system of the Canadian Sirocco Company, Windsor, Ont. The engine is belt driven, and runs the entire machinery, while steam for heating is supplied to every part of the building through the Canadian Buffalo Forge Company's fan heating system. Damien Lalonde, Limited, have installed a Canadian Allis-Chalmers generator and two Canadian Westinghouse motors of 10 and 15 horse power for electric lighting purposes. A Gould pump

The remarkable building activity in Montreal during the last three years, with the consequent increase in the demand for lumber, has resulted in several window, door and sash firms enlarging their plants or building new mills. Among the oldest manufacturers in this department of the lumber trade is Mr. Damien Lalonde, who for twenty-four years has had a factory in Montreal. Before that he owned a small mill at Valleyfield, P.Q. Recently, business increased to such an extent that a new plant was found necessary, and some three months ago Mr. Lalonde removed from St. Lawrence Boulevard to a new factory on Christopher Columbus street. With the increase of capacity, the firm was turned into a limited

Damien Lalonde Limited, Plant, Montreal, P.Q.

enables the company to obtain their own water supply at the rate of 900 gallons per hour, the well being 950 feet deep. A machine shop is also situated on the ground floor, the equipment including a grinder for knives manufactured by Cowan & Company, Galt, Ontario, also machines for sharpening saws and band saws, forge, etc.

The rest of the ground floor is devoted to the dry kiln and planing and sawing machines. The floor here is of concrete. The dry kiln is so arranged as to permit of the lumber being loaded from the yard on to trucks, which run on rails into the kiln, and after the lumber is dried the trucks are pushed through, still on the rails, into the planing and sawing room. The kiln was supplied by Sheldons, Limited, Galt, Ont., through Messrs. Ross and Greig, Montreal. The various machines on this floor are erected in a line across the centre, which allows the lumber to be conveniently and economically handled. The machines comprise: band saws, by the Macgregor, Gourlay Company, Galt, Ont.; planer, by the same firm; a No. 94 matcher, by the Berlin Machine Works, Hamilton, Ont., which turns out 150 feet per minute, and is described as an excellent machine. A small matcher and a rip saw were supplied by the Macgregor, Gourlay Company, while a moulding and clapboard machine came from the same firm.

Arrangement of the Woodworking Department

After being worked in the planing and sawing room, the lumber is conveyed to the second floor, and further dealt with. The top floor is very spacious and well lighted, being devoted entirely to the wood-working business, with the exception of a foreman's room. The space is so arranged that the machines run down one side and the joiners' benches down the opposite side, the object being to obviate unnecessary handling. The machines are also so located as to allow the various operations to be continuous. These include cross cut saw, moulder, buzz planer, sash sticker, jig saw, borer, mortisers,

Head Office—Damien Lalonde Limited, Montreal, P.Q.

View in joiners department—Damien Lalonde Limited, Montreal, P.Q.

A corner of the Sash and Door Dept.—Damien Lalonde Ltd., Montreal, P.Q.

shapers, band saws, etc., supplied by the Berlin Machine Works, the Macgregor, Gourlay Company, and Cowan and Company. The latest machine installed is a double tenoning machine, by the E. B. Hayes Machine Company, Oshkosh, Wis., in addition to this, there is one of the old-style tenoning machines. On the completion of the work on the machines, the various parts are sent to the joiners where the doors, sash, counters, etc., are completed by hand, on the benches, which number twelve. The glueing is done on the last bench, from which the work is placed on to a clamp machine, which binds the parts together. The final process is sanding, done by a Berlin sander.

From a part of the top floor is a bridge leading to a moulding shed, containing a large stock of mouldings, a second shed being located in another part of the yard.

The company are exceptionally well situated for shipping facilities, a C. P. R. siding running alongside the mill. This will allow of the unloading of nine cars at a time. For town haulage, a motor truck is used, this being particularly useful for delivery in the districts just outside of Montreal.

Pine is chiefly used, but chestnut, oak, and gum are also employed. Of late gum has come into favour, as it has a fine figure and is very clear, but it can only be utilized for interior work, owing to being affected by the weather.

In laying out the mill, the company have employed, almost exclusively, Canadian materials and machinery, there being only one wood-working machine in the plant which has been built outside the Dominion.

Wayagamack Presents Encouraging Reports

At the annual meeting of the Wayagamack Pulp & Paper Company, held at Three Rivers, P.Q., the report submitted showed net earnings of \$256,774 after making provision for all charges, including expenses of administration. After payment of the bond interest of \$105,000, there remains a sum of \$151,774, equivalent to a little over three per cent. on the common stock outstanding. The construction of the plant was designed with an initial capacity of fifty tons of pulp

Hays Double End Tenoner—Damien Lalonde Limited, Montreal, P.Q.

and fifty tons of finished paper, but so designed as to permit of its gradual extension to reach ultimately a capacity of two hundred tons of paper. The pulpwood plant was completed in sufficient time to operate during the summer of 1912, thereby furnishing the necessary supply of raw material for the operation of the paper plant, when completed and started during the following winter. Permanent running of the pulp and paper plant on the standard product was begun on the first day of January, 1913. The profit and loss statement submitted covered one year's lumbering and the operation of the pulp and paper mills for six months. A third machine is being erected and should be running by the beginning of September. Mr. J. N. Green-shields, K.C., the chairman, stated that the paper mill had only been in operation six months and the saw mill one year. The saw mill produced a yearly output of about 20 million feet, while the one million and a-half logs which were cut last winter on the St. Maurice will produce no less than 45,000,000 feet of lumber.

Dependent Entirely on Canadian Pulpwood

Figures relating to the paper and wood pulp industry in the United States, compiled in the last census have just been tabulated by the Department of Commerce and show that the value of all products of establishments engaged primarily in the manufacture of paper and wood pulp have increased 110.2 per cent. in a decade. The figures are now \$267,656,964. The report shows that American mills have practically abandoned the use of native spruce and poplar on account of its high cost and have adopted the Canadian wood, or a cheaper grade of American timber. The last available figures show that American mills use over 2,825,000 tons a year, an increase of 141 per cent. in ten years. The American mills produced about 4,500,000 tons of paper of all kinds in the last year, and of this 27.2 per cent. was news print paper. Book paper formed 16.5 per cent., cardboard 1.2 per cent., fine paper 4.7 per cent., wrapping paper 18.1 per cent., boards 19.7 per cent., tissue paper 1.8 per cent., blotting paper two-tenths of one per cent., building papers, such as roofing and sheathing 5.4 per cent., wall paper 2.2 per cent., miscellaneous 2.3 per cent.

Equipment and Layout of a Modern Mill

The New Plant of the Tourville Lumber Mills Company Near Louiseville,
P. Q.—One of the Finest in the Province

ON May 28 of this year the Tourville Lumber Mills Company commenced operations in the new sawmill constructed to replace the one destroyed by fire about a year previously. The mill, one of the finest, if not the finest, in the Province of Quebec, is situated just outside the village of Louiseville, on the Riviere du Loup, which runs into the St. Lawrence.

For one hundred years at least this district has been the centre of lumbering operations. Many years ago the Hunterstown Lumber Company did a considerable business, cutting the lumber at Hunterstown, and hauling it to Louiseville, a distance of 15 miles, from which it was shipped by boat. Later, the old Hunterstown Company erected a mill on the same ground as the present structure. The limits and the mill passed into the hands of Mr. Lafreniere, who had a fairly large mill, and from him in 1888 to Messrs. Tourville and Leduc, of Montreal, who at that time owned two other mills—one at Nicolet and the other at Pierreville Mills. In 1892 the Tourville Lumber Mills Company, with a capital of \$250,000, was formed. Five years later the Nicolet mill was sold, and in 1907 the Pierreville mill was stopped, on account of the timber being exhausted. Thus the company concentrated their efforts on the Louiseville plant.

The officers and directors of the Tourville Lumber Mills Company are: R. Tourville, president; E. Ouelette, vice-president and manager; A. Tourville, secretary-treasurer; R. Tourville, E. Ouelette, A. Tourville, A. Leduc, and I. L. Rush, directors.

Extensive Timber Holdings

The company own, in the County of Maskinonge, 338 square miles of government limits, in addition to 25,000 acres of freehold land in the Township of Hunterstown. Ninety per cent. of the lumber is spruce, the balance being pine with a little hemlock. About a third of the lumber is exported to Great Britain, a third goes to the United States, and the remainder is shipped to Montreal.

The logs are floated down the Riviere du Loup, and for a considerable distance from the mill are formed into booms, and sorted. The smaller logs for pulpwood are diverted to the pulp mill and the balance are sent to the sawmill. Both mills are situated on the banks of the river, the bulk of the shipping being done by water. The boats come right alongside the mill, and the lumber can thus be economically handled. During the winter a comparatively small quantity is hauled to the village, a mile and a half distant, and sent by rail.

The new mill is well designed, equipped with the latest machinery, and capable of turning out from 150,000 to 175,000 feet per day of ten hours.

Although the fire in 1912 destroyed the mill, it left untouched a number of the minor buildings, such as the machine-shop, oil store, blacksmith's shop, and stores-room. These are on the left hand side of the mill, and form a compact group of buildings. The machine shop is equipped with a number of lathes; the top storey is utilized as a small woodworking plant, which includes a McGregor, Gourlay planer.

The following equipment has also been supplied by the Waterous

Tourville Lumber Mills—View Showing Loading Shed

Engine Works Company:—two 8 ft. band mills, one 42-in. and one 36-in. cast steel carriage with steam set works, two 48-in. new Champion edgers, two circular resaws, two 5-slab slashers, besides conveyors, live rolls, and drives, shafting, etc.

Facing the mill is the office, a well-lighted structure, of wood, where all the general business is carried on. Next to this is Mr. R. Tourville's residence.

Construction and Layout of the Mill

The mill is very substantially built, the principal structures covering an area of 170 feet long by 61 feet wide. It has concrete foundations, with concrete walls from the basement up to the main floor. The remainder of the mill is of lumber with very solid wooden beams, bolted, supporting the roof. The basement contains belts, chains, conveyors, and other portions of the running machinery, which rests on concrete work. In the basement there is also a series of thick concrete pillars, which support the main floor.

There are both steam and electric plants. The former supplies power to the mill, with the exception of the filing room, which is operated by electricity. The boiler rooms, the electrical room (30 ft. x 13 ft.) and engine room are grouped together at one side of the mill, connected by doors. The electricity is supplied by a 35 kw. 116-120 volt 293 ampere generator supplied by the Canadian Allis-Chalmers, Limited, together with a small panel board. In addition to supplying power to the filing room, the electrical equipment lights the mill and supplies light to Mr. Tourville's residence and the office. The boilers are eight in number, all burning sawdust and refuse; six are in one building (38 ft. x 39 ft.)—these were saved from the fire—and two in another. The sawdust is collected and conveyed to both boiler

The Filing Room—Tourville Lumber Mills

General View of Main Floor Showing Gang—Tourville Lumber Mills

houses, the largest of which is 42 ft. x 21 ft. The chimney is 102 feet high, and constructed of brick, while the smokestack is 86 feet high. There are four engines, a small McEwan Waterous Engine, two 500 horse power, built by Pontbriand, of Sorel, P.Q., and one 125 h.p., of Hamilton build. Water is pumped from the river by a pump run by the larger engines.

The pulpwood cutting up mill (26x31) is in a separate building from the main mill, but is connected by means of a covered-in gangway. The logs intended for pulpwood are separated some distance up the river, and floated down. They are conveyed from the water by means of a jack ladder, and on entering the mill are automatically counted. They go to the circular saw, and are cut into four-foot lengths, although the machinery enables other lengths to be cut if desired. After leaving the saw the logs fall into a hopper, and are sent along, through an opening at the side of the mill, by chains, to a structure erected alongside the bank of the river. This structure has openings at regular intervals, which allows the logs to drop into the hold of a vessel moored alongside. The flow of the logs into the vessel is regulated by means of doors, worked by the men who are superintending the loading. On the land side of the loading structure, trucks on rails are placed, and as these are filled with the culls from the logs, they are hauled away and the rejected timber stocked in the yard. Pulpwood forms only a comparatively small part of the output of the company.

Both the pulp and saw mills are protected from damage by ice, by wooden piers, which have openings allowing the jack ladders to work down to the water's edge. These can be regulated according to the height of the river.

Economical Manufacturing Equipment

The mill proper is laid out with a view to a continuous process of manufacture. It is divided into two main divisions, with practically a duplicate set of machinery on each side, and a large gang in the centre. The logs on coming in are automatically counted on a log deck. The equipment includes two double arm flippers and two log loaders. From the log dock the logs are sent either to the right or left, and loaded on to the carriages, with log seats of steel, and operated with gunshot feed. These carriages convey the logs to band saws, which face the logs on each side, and then they go to the gang on live rolls. When the gang is fully employed, the logs are cut into boards by the band saws. The gang, which will cut 60 inches wide, is very powerful and will cut 1800 logs per ten hours. It is operated by a special engine, which is placed in the basement. From the gang, band saw slabs are conveyed to a resaw on each side, while the thin slabs are sent to other resaws on each side, or direct to the slashers. The resawn boards and those from the band saws and gang go by means of live rollers to the edgers, three in number. Continuing its journey, the lumber is butted, and then goes to an immense loading shed, 104 ft. x 22 ft., where it is culled and sorted. The boards are loaded on to trucks, which have a reversible mechanism, enabling the work to be done very quickly. The trucks run on rails, and convey the lumber to a very large yard, where it is piled until wanted.

Rejected slabs are cut into firewood by circular saws, the better portions being utilized for lath. The machinery for converting the slabs into furrings or laths are situated close to the slashers, and can thus economically use these discarded parts.

The filing room is situated over the main floor, and is reached by a gallery which runs through the centre of the building, constructed above the machinery and between that and the roof. From this passageway a view of the entire machinery can be obtained. The filing room, like the mill generally, has an abundance of light, as there are windows on all four sides. There are seven machines, including automatic band saw sharpeners, circular saw sharpeners, a brazing forge, an emery wheel lap grinder, etc. In one corner is a motor, and in connection with the electric plant. The company use Simonds Canada Saws and also Radcliff saws.

The plant includes a large refuse burner which was used for a short time, but a chipper is now installed. This is worked by electricity. The waste lumber is chipped, and conveyed to the bank of the river over an endless belt conveyor housed in a large covered-in structure built on trestles. The chipped material is emptied direct from the conveyor into barges, and shipped to the Wayagamack Pulp & Paper Company at Three Rivers.

The Tourville mill was designed and its construction superintended by Mr. J. E. Hamel, of the Waterous Engine Works Company, Limited, Brantford. The same company supplied all the machinery, with the exception of the gang and engine for running saws, these being made by the William Hamilton Company, Peterborough, Ont.

The Tourville Company's head office is at Rooms 35-36 Royal Insurance Building, Montreal.

Mechanical Pulp Demand Dull in Great Britain

The Department of Trade and Commerce at Ottawa recently received from the Canadian Commerce Bureau, London, Eng., the following bulletin: "While there is a good demand for sulphite pulp,

the market in Great Britain for the mechanical variety is at present in a somewhat demoralized state. There has latterly been such a large production of mechanical pulp in Scandinavia and elsewhere that the supply at present exceeds the demand and current quotations have fallen to a level which, it is expected will render the United Kingdom business unprofitable to Canadian manufacturers. This is probably only a temporary state of affairs, for on the other hand this Bureau has quite recently been addressed by several houses who deal in paper makers' supplies and can handle large quantities of pulp, who even now are looking for new sources of supply and are desirous of forming a permanent connection with Canadian manufacturers of both sulphite and mechanical wood pulp who are in a position to contract for regular supplies."

Trade of New England During 1913

Peculiar Conditions That Have Caused Instability in Markets Indications Favorable for Improvement

Editor Canada Lumberman:—In the winter and early spring of the present year, all weather conditions seemed to conspire to defer shipments and retard logging among the New England manufacturers. The consequence was, that although there was not a great demand for lumber here in the New England States during the winter and early spring, the great shortage tended to create a fictitious demand—that is to say—yard men here in New England, placed many orders with the mills in New Hampshire, Vermont and Maine and also in the Provinces, and owing to the difficulties, which the loggers and shippers had to contend with, they were unable to ship these orders until long after the time they were wanted.

This delay made the yard men feel that they were not going to get the stock in the spring and when they bought a lot of lumber that did not come forward, they duplicated the orders with other mills, hoping in that way, to get quicker shipment.

The consequence was, that during the last of May or early June, when conditions improved so that the lumbermen could ship their stock to the yard men, the latter found the lumber pouring in on them very rapidly and they were virtually flooded with lumber they did not need. This caused them to stop buying altogether and therefore the prices have been declining ever since, and very rapidly. Some lumber has dropped \$1 to \$1.50 per thousand feet, and it is almost impossible in buying some grades of southern pine, to place an order and find, when the lumber is shipped, that the price has held at the original purchase price, even though the shipment has been prompt.

Although we believe that lumber was abnormally high during February, March and April—that is Eastern lumber manufactured in the New England States or the Provinces—we think the subsequent drop was reasonable and much below fair selling prices.

We confidently expect a reaction to set in the latter part of August, when we believe the yard men will find that they have held off rather too long in buying their fall and winter supply and will start in with a rush and advance prices again sharply.

This kind of a market is very uncomfortable and undesirable for lumbermen, as it creates a speculative tendency and produces a very unhealthy condition. We do much better when the market is steady, with a fair demand.

We think there were many purchases made last winter, by wholesalers in Canada and the Provinces, which at the time appeared to be good, but which to-day have proved very undesirable and a good deal of Canadian lumber will be held back for late fall shipment, and some of it even wintered over until next spring. Otherwise the purchaser would have to sell at a loss. We think this lumber is largely held by strong operators who can well afford to hold it. Consequently the market will be fairly well sustained.

Also, there have been a number of large mills burned during the last six months and some of them are not to be rebuilt. This also, will help to hold the market and cut down the supply. There has been a general strike in St. John, N.B., and the manufacturers are anxious to prolong this strike for several months if possible, as they do not want the lumber and would much rather the mills would be idle, than produce stock they can not readily sell during the summer. This, also tends to regulate the market and I have strong hopes, that by early fall, as above stated, conditions will be normal and healthy again.

The South American export market for white pine through the port of Boston and through New York, has been very quiet for the past year or year and a-half. However, strange to say, freight rates by sailing vessel and steamer have held very high during that time. This seems very strange, in view of the small demand; but it is probably accounted for by activity in other carrying lines. Freights now, however, to South America appear to be dropping and we have hopes, if they come to a normal basis, that this will help to stimulate South American business.

There are some inquiries now, but no large amount of business from either Boston or New York. By South American business, we mean business to River Plate, Argentine Republic and Montevideo.—

H. B. Shepard, Boston, Mass.

A New Competitor For White Pine

Siberian Timber Which Resembles the Canadian Wood
Closely, and is Finding Favor in Great Britain

By E. Harper Wade*

The continuous advance in the value of Canadian white pine, which has been very marked and rapid of late years, has drawn much attention to the possibility of a cheaper substitute for the special purposes for which the higher grades seemed without a competitor in the markets of the United Kingdom. At one time it was the common building wood of England and Scotland, and almost every port in the United Kingdom brought in its Quebec cargo or cargoes. Its cheapness, no less than its intrinsic merits, won for it a just preference. In 1863, the shipment of white pine in the hewn log from Quebec totalled 23,147,000 cubic feet, but the current price in the raft there was then only 6 to 17½ cents for square and about 16½ to 22 cents for waney white pine per cubic foot. It was not till 1868 that square white pine commanded a higher price than similar red pine of smaller average cube. In 1863 square red pine and waney white pine were of about equal value, though the latter was much larger in size. In a contract for Quebec shipment of a small cargo, made by Lemesurier, Tillson & Company, of Quebec, with Gideon Smales, of Whitby, England, in 1832, the red pine was ten pence per cubic foot, while the white pine was under four pence. Floated pine deals, sawn at the Hamilton Brothers Hawkesbury Mills were priced for firsts and seconds together at five pounds, fifteen shillings per Petersburg standard, and spruce deals, without any named quality, at six pounds. In those days architects and builders, accustomed to the Baltic woods, gave a preference to the Canadian timber and deals that most closely resembled them. White pine, however, slowly won its way, but as the price increased, for many purposes cheaper woods took its place. The competition of pitch pine from the Southern States, spruce deals from Nova Scotia, New Brunswick and the lower St. Lawrence, but above all, Baltic redwood and whitewood, similar to red pine and spruce, limited its use in Great Britain, and its export from Canada was diverted to the United States to an ever growing extent. Still, in spite of advancing price, for certain purposes it held its own. For pattern making, and for the deck planking of first class passenger steamers it was long without a serious competitor. Canadian white pine, or *Pinus Strobus*, as it is botanically known, is free from rosin, light in weight, easily worked, very lasting, and when seasoned, neither warps, twists nor shrinks. However, within the last three or four years, a wood has made its appearance in the markets of the United Kingdom which bids fair to replace or supplant it, for many, if not for all of the special purposes for which no effective substitute had been found. Siberian pine, or as it is botanically known, *Pinus Mandshurica* or *Koraiensis*, first came forward to Europe in a steamer cargo of deals and lumber, shipped from Vladivostok to Hamburg, and was distributed thence to other ports, amongst others to those of Scotland and England. A considerable quantity was brought into Glasgow, where it attracted attention and won favor, and some also reached Liverpool. Other shipments by steamer followed, and later on waney pine in the hewn log was imported direct from Vladivostok into both Liverpool and Glasgow in considerable quantities, as well as shipments of deals and sidings into both these ports and also into London. The policy of the shippers and importers has been to keep up price as nearly as possible to that of Canadian white pine of similar grades. The wood is known in Siberia and Manchuria as Kedr, and the Vladivostok market price for export cargoes delivered on rail there in 1911 was 80 to 85 copecks per cubic foot, equal to 40 to 43 cents or 20 to 22 pence. The local market price for unassorted Kedr, sawn and delivered at Vladivostok, was 60 to 65 copecks, showing the superior quality of the wood exported, which is only that of the highest or selected grades, similar to first and good second quality white pine. Quite possibly the waney pine is cheaper than above prices, which are for sawn and seasoned lumber. The sawlog is cut to 21 feet long, and as all the waney pine that has come forward has been of that length, it has probably been sawn from selected saw logs and dressed over. The deals and sidings run 21 feet and under in length, the shorter being from butting and crosscutting for quality. Evidently the wood can be profitably sold in the markets of the United Kingdom, even allowing for the difference in ocean freight and marine insurance, at prices with which Canadian white pine cannot compete. However, it is on its trial, and has much prejudice to meet and overcome before its position is established, and it is only the lower price that will bring it into general use till it has been thoroughly tried and tested. The hewn waney wood brought into Liverpool and the Clyde did not sell readily at first, consumers preferring the Canadian wood at about the same price, but recently considerable concessions have been made by holders, and it is being used at both places. During the half year ending 30th June the consumption of

Siberian pine in the hewn log in Liverpool was 41,000 cubic feet, which included 27,000 feet in the month of June, following the price reduction. Sale figures are strictly private, but undoubtedly much under anything Canadian waney pine could be imported at. In some cases the logs are reported as cutting up satisfactorily, in others it is asserted that though the outside planks were like white pine, towards the heart the wood showed red and resinous, approximating to mild red pine, or Archangel wood. Quite possibly there may be a partial return to white pine later on, even at the higher price, probably sufficiently to enable the clearance of Quebec stock of that wood and last winter's manufacture, but this is all in the uncertain future. It is certain to compete with and limit the consumption in the United Kingdom of Canadian white pine deals and sidings, for some time past a decreasing business. However, as it is beyond question that all the wood obtainable in Canada will eventually be required for consumption there and in the States, this only affects the export trade to the British Isles. At the present time all wood for export has to be brought to Vladivostok by rail, either over the Ussuri Railway that runs north from that port to Khabarovsk on the Amur River, or on the Chinese Eastern Railway which runs across Manchuria and connects with the Russian Siberian system, of which it really forms part. Both these lines bring Kedr and other wood to Vladivostok, but the cost of rail carriage forms a considerable proportion of its value there. In the not very remote future it is probable that timber will be rafted and floated down the Amur River to Nicolaievsk at its mouth, and shipped from there or some adjacent point. In such case it should approximate in cost with shipments made in the middle of last century from Quebec, as Siberia is now in the same stage of development that Canada then was. What wood was then delivered at for shipment at Quebec records show, as recapitulated and tabulated in the Canada Lumberman of 15th June last. The Russian Government is making every effort to develop Siberian resources and encourage Siberian trade, and there is a great opening for Canadian experience, enterprise and capital to develop the export trade of Kedr, and probably other woods, on Canadian lines, or possibly the capital might come from England under Canadian management. Some two or three English firms have already representatives at Vladivostok, who buy and ship to the houses they represent, but the production and manufacture is generally in Russian hands at present. There is a considerable consumption at Vladivostok and other local points for building and other purposes. The supply of standing timber is practically unexhaustable, and a considerable export trade to China exists, while some shipments are made to Australia and other places outside the United Kingdom. Labor is obtainable on reasonable terms, as the government is inducing and encouraging migration from European Russia. Under experienced management an immense trade with the United Kingdom might be developed, as forest concessions, equivalent to timber limits, could be obtained on reasonable terms by going about matters in the right way through proper channels.

Lumber and Deal Measurement Methods

It may seem something like carrying coals to Newcastle, to tell readers of the Canada Lumberman how lumber and deals are measured in this country and the United Kingdom, but there are a few features regarding which confusion sometimes arises. Therefore, the following explanation furnished by Mr. E. Harper Wade, of the Harper Wade Export Company, Quebec, P.Q., will be of interest:—

Sawn lumber is measured, bought and sold in the United States and Canada by the thousand feet board measure, the foot being twelve inches square by one inch thick, or one twelfth of a cubic foot. In the United Kingdom the commercial factor is the St. Petersburg standard. Hundred, commonly called the Petersburg standard, which is the equivalent of 1980 feet board measure. All contracts for imported goods are made on that basis, also sales by importers to consumers in England. On it are based all freight settlements, but in Scotland the retail business is usually done by the cubic foot, of which the St. Petersburg Standard Hundred contains 165. In Ireland, especially in connection with spruce deals, the Irish Standard Hundred is still used in sales by importers to consumers. It is based on 120 pieces, 12 feet long, 3 inches thick, 9 inches wide, and contains 3,240 feet board measure. The Petersburg standard deal is the equivalent of a piece 6 feet long, 3 inches thick, 11 inches wide, or 16½ feet board measure, thirty of these form a Quarter, and four Quarters, or one hundred and twenty pieces form one Standard Hundred.

The Quebec Standard Hundred was for many years universally used in connection with sales of deals in Canada by the producer to the shipper, but now only exists in such sales of Ottawa pine deals. It contains 2750 feet board measure. The Quebec standard deal is the equivalent of a piece 10 feet long, 3 inches thick, 11 inches wide, or 27½ feet board measure, one hundred of which form the Quebec Standard Hundred. The price per thousand feet board measure is four elevenths of that per Quebec Standard Hundred.

*President of the Harper Wade Export Company, Quebec, P.Q.

River Ouelle Company Extends Operations

Will Operate New Mill at River Manie on September 1st—Description of
The Company's Three New Plants

J. R. Power, Resident Manager.

Readers of the Canada Lumberman are already familiar with the operations of the River Ouelle Pulp and Lumber Company, whose headquarters are located at St. Pacome, P.Q. In the annual number of this journal, published on September 1st, 1912, an interesting illustrated article appeared, dealing with this company's plant at St. Pacome and describing its logging operations. We are now able to supplement this article with an illustrated description of their new plant at River Manie and an outline of the equipment of two of their other plants at Powerville and Crown Lake.

The River Manie plant is situated on the eastern part of the company's limits, viz., lot 34 of the 9th range of the township of Woodbridge. The main building

of the River Manie plant is 133 x 44 feet, with two extensions 36 x 20 feet each, for lath mill and trimmers, etc., respectively. The building is constructed of spruce and tamarack laid upon concrete piers and covered with corrugated galvanized iron roofing. The height between the floor is 13½ feet and the height above the sawing floor is 10 feet. The machinery in this plant consists of one gun-shot steam-feed Rotary saw, one large double edger (40 inches), one re-saw, slashers, trimmers, biggers, kickers, log-rollers and live-rolls and transfer chains throughout; also a lath mill and bolter.

The power house is 36 x 42 feet, built of structural steel with corrugated asbestos sheeting and roofing. A height of 18 feet clear has been provided under the beams.

Power is supplied from two boilers 72 inches x 16 feet tested to carry a working pressure of 125 pounds, with engine 18 x 20 developing 230 h.p. The boilers were supplied by the Jenckes Machine Company of St. Catharines, Ont. The smoke stack is 80 feet x 54-inch diameter. When the accompanying photograph was taken, the smoke stack has not yet been put up. All the machinery in the power house was supplied by the E. Long Manufacturing Company of Orillia, Ont. The mill is being erected by Mr. Maurice Walsh, the company's millwright, who expects to have the plant in operation by the first of September.

The mill will have a capacity of 45,000 feet of sawn lumber and 20,000 lath per day. It will be operated chiefly upon spruce, with a small percentage of white pine and cedar.

Adjoining the mill the company has a yard with an area of 20 acres, located along the line of the National Transcontinental Railway. Shipments will be made by this line and its connecting lines. The lumber will practically all be disposed of in the New York mar-

Interior view of River Manie Mill.

ket. During the present year, on account of the lateness of the season when operations are commenced, only about one and one-half million feet will be cut. Next year however, this quantity will be increased to about five million.

The Powerville mill contains one rotary saw, edger, re-saw, lath mill, trimmers, kickers, niggers, live-rolls, transfer chains, etc., and has

35 miles an hour on the Company's gasoline motor.

a capacity of 35,000 feet per day. The power house is equipped with one 125 h.p. boiler and engine, developing 100 h.p. The average yearly cut at this mill will be about five million feet, three million of which will be cut in the summer and two million in the winter.

River Manie Mill—View looking west.

Winter view of Crown Lake Mill in operation.

Plenty of logs in the pond—River Manie mill.

A fair stand of Spruce on River Manie limits.

The Crown Lake mill is equipped with one rotary saw, edger, re-saw, trimmers, lath mill and bolter and has a capacity of 18,000 feet per day. It has been built for winter sawing. The yard of this mill is also situated along the National Transcontinental Railway a short distance from the mill.

The River Ouelle Pulp & Lumber Company have secured excellent detailed topographical maps of their limits showing the layout of the land and extent of timber, as well as its quality. The operations upon this particular section will be confined to the furnishing of logs for the three mills above described, as the timber is located on the head-waters of the River Ouelle. The acreage is divided into three sections according to water sheds. This section of the limits contains 40,000 acres of Crown Land and 5,000 acres of freehold lands.

The River Manie is divided into three branches, a short distance above the mill. These are known as the east, middle and west branches. About 2½ miles above the mill, on the west branch, a dam has been built for storing logs until they are required at the mill below. This reservoir will also be useful in connection with the timber driving operations in the spring and late in the summer. It is estimated that the reservoir will hold one and one-half million feet of timber. The company will soon commence the erection of another dam on the east branch, which they expect to have completed for next spring's operations.

Death of Hon. John Sharples

We report with regret the death of Hon. John Sharples, senior member of the old and widely known firm of lumbermen trading at Quebec under the name of W. & J. Sharples. Mr. Sharples had been in poor health for a number of years, but in spite of frequent illness was able to rally from each attack but the last. Until quite recently he frequently appeared at business, and was welcomed by his old friends in the Quebec lumber and timber trade. Mr. Sharples is survived by his wife and one brother, Mr. H. H. Sharples.

The late Hon. John Sharples came from a very old and prominent Catholic family of Lancashire, England. The firm of W. & J. Sharples, of which he was the leading member, is the oldest in the Quebec square timber trade, having been established in 1816 by Wm. Sharples of Liverpool, England. The business was taken over in 1840 by his son, Henry Sharples, and subsequently by Richard Wainwright and Chas. Sharples, who were succeeded by the late Hon. John Sharples and the latter's sons, Wm. and John Sharples. On the death of William the late Mr. Sharples became the sole owner. A few

years ago he took into the firm as partners Mr. Wm. Power, and more recently the late Mr. R. Harcourt Smith.

Hon. John Sharples was born in Quebec in 1848 and was educated at St. Mary's College, Montreal. He married in 1871, Margaret, eldest daughter of the late Hon. Chas. Alleyne, Q.C., who came of a distinguished Wexford, Ireland, family. After leaving college, Mr. Sharples went into business with his brother and almost immediately came into prominence as a man of successful business instincts and of the highest integrity. He held many offices of trust and honor and at the time of his death was Honorary President of the Union Bank. He was a former member of the Quebec Harbor Commission, Director of the Quebec Bridge Company, Director of the Quebec Railway, Light, Heat and Power Company, Director of the Prudential Trust Company, Director of the Quebec Steamship Company, President of the Chronicle Printing Company, since 1900, former Vice-President of the Quebec Northern Railway Company of Canada, President of the River Ouelle Pulp & Lumber Company, and former President of the Canadian Club in Quebec, and in addition to his numerous business activities the late Hon. John Sharples was keenly interested in charitable institutions and gave generously to their support.

In 1907 he was created a Knight of St. Gregory, by his Holiness the Pope, for distinguished services rendered the church and in recognition of his Christian character. In 1893 Mr. Sharples was called to represent the Stadacona division in the Legislative Council in the province of Quebec. He cared little, however, for public honors, and never sought them. He was of a modest, retiring disposition, a man who loved his home and the company of his family and their circle of friends. He took a deep interest in the welfare of Quebec and never hesitated to use his influence, when requested, in support of any worthy public or private enterprise. In good works his generosity was unbounded. His disposition was kind and genial. He was in every sense of the word a gentleman. His loss creates a vacancy among the citizen of Quebec which cannot be filled.

Reports recently sent in by the government forest rangers of Vancouver Island, B.C., state that the prolonged warm and dry weather has turned the immense forest areas of the island into a veritable timber box. These reports are corroborated by lumbermen in various parts of the island. The government and the lumber companies have redoubled their efforts to prevent the spread of fire. A ground fire commencing under present conditions and gaining headway would soon become a crown fire and cause incalculable loss.

British Columbia Minister of Lands

Hon. Wm. R. Ross K.C. a Man in whom Lumbermen are Keenly Interested—Reticent and Resourceful—A Man of Many Responsibilities

The Hon. William R. Ross, K.C., Minister of Lands for British Columbia, is a personality of great interest to the lumbermen and all interested in forestry in the Dominion, if not on the continent, for his forest policy, under which the timber industry of that province is administered, is one which has attracted wide attention. The Minister of Lands is a descendant of some generations of the clansmen of Ross who came to this country over a century ago in the service of the Hudson's Bay Company, and he first saw the light at the far-flung post of the H. B. Co. at Fort Chippewyan on Lake Athabasca. His grandfather, Chief Factor Donald Ross, who ruled the north country for thousands of miles from his post at Norway House when the last century was young, and his father, Donald Ross, Chief Trader at Fort Chippewyan, pioneered the way in the empty places, started the work of Empire-building in the great west and have bequeathed the work as an inheritance to the Minister of Lands who now administers the great areas where his fathers blazed the trails.

Although it is but ten years since the Hon. W. R. Ross entered public life in the broad western province, and although scarce three years have passed since he took charge of the Department of Lands, his wise utilization and unfolding of the resources of British Columbia have won him great praise, and his forest policy has attracted the most wide attention. He is diffident in the extreme, unobtrusive and most backward in discussing himself; but as a worker in his chosen field of endeavor he is most energetic and the effect of his personality in this regard has been shown in the progress made by the Department of Lands since he took over the reins of office.

Soon after his birth at Fort Chippewyan, following upon the death of his mother, his father took him to Fort Garry and gave him into the keeping of his grandmother. He watched the transformation of the H. B. Post into a great city, and took his Arts course at St. John's College there, graduating with the degrees of B.A. and M.A. Then he enrolled as a law student at Winnipeg, and, after graduating, joined the firm of Munson and Allen, leaving them to enter into partnership with Mr. Nugent. In 1897 he left Manitoba for British Columbia—the call of the heritage bequeathed to him by his ancestors was not to be unheeded. After practising law in Rossland, and East Kootenay he entered public life in 1903, being elected for Fernie riding as a supporter of Sir Richard McBride, K.C.M.G., who had then given British Columbia its first party government. He still represents Fernie in the legislature.

The Hon. William R. Ross took up his work as Minister in charge of the Lands Department, a department which comprises four main branches,—lands, forests, surveys and water rights,—in the autumn of 1910. Almost his first official duty was to receive a report of the Forestry Commission that had been appointed by Sir Richard McBride a year and a half before to investigate the forest problems of British Columbia. The issue of timber licenses covering 15,000 square miles of timber land during the three years, 1905-6-7, had placed the province in so strong a financial position that the money necessary for establishing a forest administration on a thoroughly up-to-date business footing was then available, and it was, therefore, with particular interest and a free hand that the Minister took over the conclusions at which the Forestry Commission had arrived and began his study of the practical handling of the great timber resources of the province.

Forest Protection

The excellent Bush Fire Act requiring every person burning slash during the first season to obtain a permit from a fire warden was passed before the Hon. W. R. Ross entered upon his work and all that it was necessary for him to do in 1911 was to organize and enlarge the existing fire warden staff. That year 110 district patrolmen were placed under 12 inspectors. The season was very favorable, and the total expenditure was under \$150,000.

The beginning of the year 1912 saw the successful result of the application of the Railway Commission, calling upon that body to undertake the work of fire prevention along the railway lines under federal charter in British Columbia. The excellent system of patrols and the general supervision of railway rights-of-way that was then established by the Railway Commission put an end to the appalling destruction of timber that has been so disastrous a result of railway

Hon. Wm. R. Ross, K.C., B.C.'s
Minister of Lands

operation in this province, the only exception being in connection with the slashing of the Grand Trunk Railway right-of-way on the South Fork of the Fraser river, where some very bad fires in the early spring destroyed about 100,000,000 feet of first-class timber before the organization of the department had taken the field. It is worthy of note that no further fires occurred along the G. T. P. once the patrol force had been placed on duty, and, though weather conditions helped to produce this result, yet it was also a striking evidence of the usefulness of a patrol force. Generally speaking forest protection during the summer of 1912 was continued in much the same way as in the previous year, for, although the recruiting of the permanent staff of the Forest Service was nearly completed, it was obviously undesirable to make radical changes at once. The number of wardens was doubled as a preliminary measure, however, and the sum of \$208,000 expended on the work. Again the weather favored with an excellent season.

The present year has seen the handling of Forest Protection as a local matter by each District Forester, under the inspection and general control of headquarters. That far greater attention is being paid to patrol is shown by the fact that the reports of the District Foresters called for the employment of 250 men, who are now on duty. The idea has been to put on the minimum force necessary for the full five months of the fire season and to keep increasing it so as to have the largest possible number of men on duty at the height of the danger season.

Much interest has been displayed by the Hon. Mr. Ross in the electrical exhibits that have been a feature of some of the lumbermen's meetings in the Northwestern States, where voluntary associations of lumbermen have done such excellent work in organizing fire patrol. The Forestry Department of British Columbia is now pushing the construction of a number of field telephone lines which cost from \$50 to \$60 a mile when strung up through the trees. The light-weight temporary lines that can be connected with these in emergencies so that the warden in charge of a fire can keep in touch with his base of supplies without leaving his crew of fire fighters, will also form part of the field equipment. Many lumbermen have shown interest in these cheap, portable telephone sets, and they are being frequently used in connection with lumbering operations. Furthermore, look-out stations are being built on mountain tops, and connected by 'phone with the district headquarters.

The slash problem is one that has given a great deal of trouble, but practical results are now being obtained. For instance, a considerable number of operators have begun to burn their slash each season, and some success has been achieved in requiring railway companies to do the same thing. The Grand Trunk Pacific Railway Company have been piling all slash from tie cutting during last season's construction, and the irrigation interests in the Okanagan, who were afraid that the construction of the Kettle Valley line would jeopardize the watersheds, have shown much appreciation of the slash-burning done by the latter company. The Forest Act provides for the condemnation of bad fire traps as public nuisances, for the surrounding of logging and slash by fire lines when necessary, and contains a very complete set of provisions for handling the forest fire problem.

After the placing of timber lands under reserve at the end of 1907 it was impossible to obtain timber from the Crown until the passage of the Forest Act of 1912, which provided for the making of timber sales. This Act was amended last session so as to make the selling of timber as simple a matter as possible. Timber for sale is cruised and surveyed by the Forest Branch, given an upset price, and then advertised for sale for two months unless it is under three million feet, when shorter advertising periods are required. So far the bulk of the sales have been small fractions adjoining other holdings where operators are logging, though the department has sold as high as forty-five million feet at one time. All these small sales are for immediate logging, and from 50c to \$2 per thousand feet is obtained in addition to the royalty. On the Coast the figure ranges usually from \$1.00 to \$1.25. So far, no large sale projects have been considered, the department having aimed only at supplying the immediate needs of operators. In connection with its timber sales and cruising work the Forest Branch makes a considerable number of land examinations in order to ascertain whether land is more suitable for timber growing or for agriculture.

Note of Optimism from the West

J. G. Robson of New Westminster Predicts Increasing Trade for B. C. in the East—1914 to be a Big Year

Mr. J. G. Robson, president and managing director of the Timberland Lumber Company, Limited, New Westminster, B.C., made a business trip through Ontario during the first two weeks of the present month and was a welcome visitor at the offices of the Canada Lumberman recently. Mr. Robson left New Westminster on July 1st, coming east by way of Sudbury and the Soo. The return trip was made by way of Fort William. Discussing trade conditions, Mr. Robson said:—"The way things stand down here, it looks to me as though we in British Columbia have only been getting the big end of the business, such as the railroad and large contract demands and have been letting the pick of the business go to the southern pine people. During my visit to Ontario I have almost invariably received a very hearty welcome from the smaller concerns and I look for good business along these lines in the future. I think our time is coming, especially when things brighten up on the other side and the southern pine people strengthen their prices. Then we will be able to do a very satisfactory business in eastern Canada. We are already getting some of the business and when the Panama canal opens we will get a lot more.

"At present our freight rates are very hard on us. You see our present freight rate on fir timbers to Toronto is about \$21.50 and to Montreal \$22.50. You can just see how much we are getting out of the business under these conditions. The freight rates are larger than the cost of the lumber. When the Panama canal opens the steamship companies will go after the business vigorously and will give competitive rates. They will be able to give fast service and guaranteed deliveries. We can get guaranteed deliveries now by way of the Tehauntepec Railway. I can see that when the canal is opened we will get the majority of the business. The southern pine timber is smaller and more or less rough and they prefer working on the small sizes. We prefer to sell the heavier stuff. We would rather cut 24 in. x 24 in. than 6 in. x 6 in.

Delivery the Chief Trouble

"Our big difficulty is the time of delivery. So many of the builders here say to contractors, 'here is your contract; you must have the first floor up in such and such a time, and the second floor in such and such a time.' That does not give time to get the specifications to the coast and have the stuff cut. If the architects here would get out their specifications sufficiently in advance, we would get into the business alright.

"The railroad companies are now getting the freight service down much better. We have been getting fairly fast service of late. The fastest shipment I have had was about eighteen days from the coast to Cobourg, Ont. You can figure thirty days as a safe shipment in almost all cases. This applies particularly to competitive points and we have pretty good competition between the Great Northern and the Canadian Pacific Railways. The Great Northern has promised to put all the B. C. lumber business on fast freights. They are going after the business energetically.

Improvement Near at Hand

"Of course things are a little dull in the west just now, but next year is going to be a good year. The war situation is cleared up now and the tariff situation will have been cleared up then. Wild speculators will be thinned out and the banks loosen up. From now on business will pick up. The prospects for the crops are excellent. Of course this brings a few million dollars to us in the west. The railways are bound to go ahead with their branch lines next year as they

put off construction of many of them this year. The double tracking of the C. P. R. out there is going to use up considerable material."

Taking things all round Mr. Robson found that there was every reason to expect a steady and solid improvement in the lumber trade in western Canada and from his visit in the east he had also concluded that much the same conditions could be counted upon in that part of the country also.

B. C. Sawmill with Electric Drive

Plant of E. H. Heaps & Co., Ltd., at Ruskin Cutting 250,000 feet lumber, 500,000 shingles and 50,000 lath Daily

Construction was in progress during the whole of 1912 on a modern, electrically driven, sawmill for E. H. Heaps & Company, Limited, at Ruskin, a town on the main line of the Canadian Pacific Railway, about 33 miles east of Vancouver, at the junction of the Stave and Fraser rivers. The sawmill building is 80 x 500 feet, three storeys in height, with the filing room on the top floor. In designing the mill the engineers adopted as far as practicable the principle of the individual motor drive. Practically all the machinery is driven by motors. The carriages, log turners, kickers, etc., are, of course, driven by steam, and the trimmers by compressed air. The sawing machinery consists of a 10-foot Allis single cut band; an 84 x 12 heavy Allis Pacific Coast edger; 7 ft. Merzhon band re-sawing machine; automatic air trimmers, slab slashers, etc.; Stetson-Ross automatic sizing machine. The mill is also equipped with the latest Simonson log turners, kickers, automatic transfers, etc.

The motors for this mill are mainly Allis-Chalmers-Bullock type, and the company in ordering motors endeavored to secure ample horse power for the particular work in view. The log haul, which is a heavily geared Allis rig, is operated by a 30 h.p. motor. The 10 ft. single cut Allis band is run by a 300 h.p. motor connected direct with the arbor. The gang is operated by a 150 h.p. motor. The Merzhon re-saw and transmission in connection with same is driven by a 150 h.p. motor. The automatic trimmers and slashers are operated by 50 h.p. motors each, directly connected.

The mill commenced cutting on February 10th last, running on the main side only, and it is the intention of the company to operate the balance of the plant as fast as the machinery is installed. The shingle mill, lath mill, dry kilns and shipping shed, etc., are still under construction. The plant, when completed, will have a daily cutting capacity (10 hours) of approximately 250,000 feet of lumber, 500,000 shingles, and 50,000 lath.

A modern steam plant has been installed for the purpose of supplying steam to the mill. The building is substantial in construction and ample power has been provided to cover any future demands that may arise.

In connection with the mill operations a large amount of wharfage has been constructed, the work being carried out on a plan that assures permanency and ample room for all purposes. Logs are supplied to the plant from the company's extensive timber limits up the Stave Valley. The timber is delivered to the mill boom by the Ruskin Logging Railway, owned by the company. Considerable money was expended last year on the extension of the railway line, and on additions to the equipment, by which the plant has been brought fully up-to-date. Oil has been substituted as fuel for practically all of the logging machinery, with most satisfactory results.

The company own the valuable townsite of Ruskin, and contemporary with the work on the mill plant, new dwellings for employees and others were erected. Grading work on streets was also carried out, and the appearance of the townsite greatly improved.

A Modern Electrically Driven Mill—E. H. Heaps & Company's Plant at Ruskin, B.C.

Columbia River Lumber Company's Fine Electrically Driven Mill at Golden B.C.

A Modern Electrically Driven Sawmill

Splendid Equipment of an Important Mountain Mill—Logging Conducted by Railroad—Columbia River Lumber Co., Golden, B. C.

One of the largest and most modernly equipped saw mill plants in Canada, to-day, is that of the Columbia River Lumber Company, Limited, located at Golden, B.C. To begin with, the location itself is ideal. The town of Golden being situated on the banks of the upper Columbia River, and on the main line of the Canadian Pacific Railway about 160 miles west of Calgary, and at this point also is the junction of the Kootenay Central Railway with the C. P. R. The sawmill plant is on the south edge of the town proper, and, unfortunately is not visible from the railway station. It would however, be well worth the time of any traveller to stop a few hours in the busy growing little town of Golden and visit this most interesting plant.

Back of every large saw mill industry must be large timber holdings, if the institution is to enjoy a long and successful career. This company's Dominion and Provincial timber limits comprise the most extensive holdings in the possession of any concern in the interior of British Columbia, and extend many miles along the Columbia River, Shuswap Lakes, and Eagle River. The limits contain a fine growth

of mountain fir, pine, spruce and cedar timber. It is said that the company will, in the near future, erect several other large mills at suitable points in the mountains, and even these, together with the Golden mill will have to be operated many years before any serious inroads are made in this immense forest area.

Extensive Railroad Logging Operations

At the present time the company is concentrating its logging operations on several large tracts of timber a few miles west of Golden. These limits produce the celebrated Columbia River white spruce which is so much in demand in the Prairie Provinces. Some of the finest of the timber is situated at an altitude of over four thousand feet above sea level, and two thousand feet above Golden, necessitating a railway system of logging.

The company began the construction of their logging railway in the fall of 1910 and since then have been constantly extending and improving it, until to-day, it is safe to say, it is the equal of any logging railway in western Canada. The railway landing is on the banks

Loading a Logging Train—Columbia River Lumber Co., Golden, B. C.

Illustrating the Ability of the Log Loader to Handle its Work.

Unique Camp Quarters—Cars for Bunk Houses

of the Columbia River about five miles south of Golden, to which point the company's log booms extend. Thus the logs are practically in the mill booms as soon as dumped from the railway cars into the water. At this point the company have constructed a fine lift-span bridge across the Columbia river, giving them connection with the Kootenay Central Railway, thus facilitating the transportation of the large quantity of logging and railway supplies necessary to carry on an undertaking of this magnitude. At this point also is situated the large round-house and repair shop of the railway, together with the landing camp buildings, and several neat cottages.

From Canyon Creek Landing, the logging railway main line threads its way up and over the foot hills and benches into the timber, a distance of ten miles, with a grade of from 2 per cent. to 5 per cent. The road-bed is well constructed and the general lay-out of the road gives evidence of some clever engineering in its location, and in the overcoming of seemingly unsurmountable grades. Several switch-backs are negotiated before "Camp 19" is reached. This camp is perched on the side of the Selkirk range, over 4,000 feet above the sea level and about 2,000 feet above Golden, giving some idea of the problems involved in the construction and operating of the railway. At convenient points branch lines run out into the best timbered areas. Altogether there are in operation over 17 miles of track.

Efficient Railway Equipment

The railway equipment, all of which is of the most modern type and efficiency, consists of three powerful Heisler geared locomotives, three Barnhart steam log loaders, one hundred logging cars, three oil tank cars, several box cars and flat cars. The locomotives have all recently been equipped with oil tanks and burners for fuel oil, doing away with coal as fuel, thus securing more efficiency in operations, and minimising the danger of setting fire to the timber. The fuel oil is brought from tide-water in the company's steel tank cars. The railway is now equipped to haul and deliver into the booms 300,000 feet of logs per day.

Three large logging camps in operation all the year round are necessary to cut and skid logs to the railway track. The skidding in the past has been done in the usual manner in handling this size timber, by the use of horses, of which the company's stables contain over one hundred head. However, there has recently been installed at Camp 18 a most modern and up-to-date Ariel skidding machine constructed by the Washington Iron Works of Seattle, Wash., especially for use in mountainous country. This machine is especially adapted for logging on steep hill sides, difficult of access for horses. Its overhead cables, reaching out 3,000 feet, bring within reach a considerable area of timber, without the necessity of moving the mach-

Bunk House Cars are Easily Transported

ine except at intervals of three or four weeks. After being topped the entire tree is cable-hauled in to the skidway and sawed into proper lengths there. The ariel skidder seems destined to displace the horse almost entirely in mountain logging. The capacity of one of these machines, working in average timber is 35,000 feet of logs per day. It is said that the company intend to install a number of these machines in the near future.

Unique Camp Accommodation

A novelty in camp construction consists of a number of so-called camp cars of a size about 8 ft. x 20 ft. fitted up as bunk houses, cook houses and offices, and so constructed that when it is necessary to move camp, they can be picked up by the powerful lifting device of the Barnhart log loading machine placed aboard the railway cars and transported to the new camp site, and there unloaded in the same manner, almost without disturbing their contents and with very little labor or inconvenience. This system of portable camp buildings does away with the building of the old type of camp shacks, which, when the timber was all cut in their vicinity, became almost a dead loss to the company. It is also a much more economical proposition than camp cars built permanently on railway trucks, as no money is tied up in rolling stock. The employees of the logging and railway department of the company number from 350 to 400 at all times. This department is in charge of Mr. John Hinchy, a competent logger of many years' experience, both in the United States and Canada.

The Mill and Its Equipment

To see the big mill of the Columbia River Lumber Company in operation, especially at night by electric light, is a most interesting sight. The plant is in every way qualified to rank as the best modern sawmill in the interior of British Columbia. The sawmill equipment is of the most up-to-date type, and consists of two eight-foot double cutting band mills with three block fast steam feed carriages; a Giddings & Lewis 48-inch gang saw with steam press rolls; two double edging machines, an automatic trimmer, slasher, lath mill complete, trim saws, and filing machinery. With the exception of the steam feed carriages and kickers, all the machinery in this mill is electrically driven by separate motors rating from 5 h.p. to 250 h.p. each.

Power is generated in the adjoining large fireproof boiler and engine house, which is constructed of reinforced concrete with steel roof. This building contains a battery of eight 66-inch by 16 foot, high pressure steam boilers, and Dutch oven firebox equipment with automatic sawdust feed.

The turbine room is equipped with a Hugh Parsons' steam turbine connected with an Allis-Chalmers 1,000 kw. generator, which

Bunk House Car at a Temporary Camp

The Logging Railway Locomotive

develops 1,300 horse power, and is capable of handling up to fifty per cent. overload. This room also contains the exciters, switchboards, voltage regulators, etc.

The Sorting Equipment

On the sorting platforms, which cover an area of 10,000 square feet, immediately adjoining the sawmill, the lumber coming from the trimmer is carried out on chains to be graded and sorted as to widths and lengths, and then loaded on to tram cars to be taken to the yard and piled. At the end of the main platform all the dimension and stock suitable for shiplap drops on to a 255 foot endless "Gandy" belt, which rapidly and smoothly conveys it to a second set of chains on another platform leading up to the big Stetson-Ross sizing machine and shiplap machine. Here the dimension is quickly surfaced and sized, and the boards are converted into shiplap and run out on to the final transfer chains where they are piled on the trucks ready for the yard. When this stock is seasoned it can be loaded for shipping without the necessity of sending it to the planing mill for further manufacture.

The refuse of the sawmill is taken care of by a large water-space burner. After the best material has been picked out for lath stock and slab wood the balance of the refuse is carried on chains in a huge conveyor to this burner. The burner is 32 feet in diameter and 90 feet high, and was built by the Muskegon Boiler Works Company, of Muskegon, Mich. It is constructed of heavy boiler plate, two walls with 14-inch water space. Hot water for the boilers is drawn from this burner. The sawmill is operated day and night and its average cut is 350,000 feet of lumber in 20 hours run. A prominent lumber manufacturer from the coast recently remarked that "the Columbia River mill is all ginger and snap, and things move so fast that it is almost bewildering to me."

The yard scheme is a marvel of neatness and efficiency. The green lumber is transported from the sorting platforms to the yard on small four-wheel tram cars run by gravity, on 20-lb steel rail tramways. This tramway system extends through every lumber alley in the yard, and to the planing mill and yard unloading platform, and comprises over 14 miles of narrow gauge track and 150 tram cars. The yard is well laid out, with a capacity for piling 40,000,000 feet of lumber. The beautiful alignment of the lumber piles in each alley indicates that only expert lumber pilers are employed.

Planing Mill Operated

The planing mill, where the final manufacturing is done, is situated about 600 feet east of the sawmill and convenient to the yard. This mill is equipped with nine fast feed machines of the latest designs. All of the lumber is loaded on to the cars direct from the planing mill, except the dimension and shiplap which is taken care of direct from the pile to the car on a separate yard loading platform. Most of this stock is shipped to the Prairie Provinces, where it is in great demand on account of its uniform quality and the excellence of its manufacture.

Adjoining the planing mill is another concrete power house building. This building contains a 250 h.p. Atlas engine which furnishes power for the planing mill, and also the fine electrical equipment of the Golden Light Power & Water Company, Limited, which is a subsidiary company of the Columbia River Lumber Company, and furnishes light for the town of Golden, as well as the plant of the company.

The company operate a large general store and several supply warehouses, and have a commodious boarding house for the single men, with a large annex for sleeping quarters. Their large stable accommodates forty-five horses.

The office is a two-storey frame structure conveniently situated, and containing well lighted office rooms for the general manager, assistant sales manager, assistant secretary, and office staff. Overhead are sleeping quarters for the office staff.

The company have recently erected a number of pretty modern cottages for their married employees. These dwellings are five and six rooms in size, with bath, water and light, and are rented at a very nominal figure. It has been the aim of the management to gather around them competent steady married men, upon whom they can depend at all times. Altogether they rent about thirty dwelling houses to the employees.

The Company's Officers and Staff

The men at the head of affairs are Col. A. D. Davidson, president; Col. A. D. McRae, vice-president, and J. D. McCormack, secretary, with offices in the Vancouver Block, Vancouver, B.C. The active management of the company is, however, in the hands of Mr. L. D. Rogers, general manager, with headquarters at Golden.

Mr. Rogers, who has had charge of the company now for about a year, was formerly general manager of the Anacortes Lumber and Box Company, of Anacortes, Washington. He is one of the seven Rogers brothers who have all become famous as expert sawmill men in the United States and Canada. To him is due in a very great measure the present high efficiency of the Golden plant, as he has

spared neither time nor energy to make it second to none in the mountains, and by the evidences at hand, he has succeeded well.

Mr. R. L. Rogers, brother of the manager, is general superintendent of the plant, and has direct supervision of the sawmill. Mr. R. L. Rogers was formerly with the Canadian Western Lumber Company, at Fraser Mills, B.C., and is an experienced and capable sawmill man.

This article would not be complete without some mention of the river traffic on the Upper Columbia. The Upper Columbia Transportation Company, which is also a subsidiary company to the Columbia River Lumber Company, Limited, operates two steamboats on the Columbia, plying between Golden and Windermere Lake. The Klahowya is a fast passenger boat, carrying passengers and mail, and making three round trips between Golden and Windermere each week. This steamboat is fitted with every comfort and convenience for its passengers, and a trip up this famous scenic waterway on the Klahowya is a pleasure long to be remembered. The Nowitka is designed as a light draft freight boat, with limited accommodation for passengers, and operates flat bottom scows in connection, with a capacity of 125 tons of freight. Owing to the rapid development of the upper Columbia Valley a large portion of the freight of this boat is lumber which is shipped to all points along the river.

Log Rules for Western use Compared

Diagrams and Curves Illustrating Results Secured From Various Scaling Methods Used in the West

By A. H. D. Ross*

In the Canada Lumberman of August 1st we considered nine log rules for the measurement of eastern timber. In this issue we will compare ten rules for the scaling of western timber. As in a former article, we will assume a length of 16 feet so that comparisons may be made between the rules already described and the new ones now coming up for discussion, but, on account of the size of western timber it will be necessary to extend the diameters to sixty inches instead of thirty inches. As before, we will arrange the figures in descending order of magnitude, as shown in the following table.

16 Foot Log Lengths

Diameter	Baughman Band Saw	International	Baughman Rotary Saw	Clement	Scribner	Spaulding	North-western	Lumbermen's Favorite	British Columbia	Doyle
6	20	20	17	19	18	—	—	—	—	4
8	41	45	41	37	32	—	33	—	—	16
10	73	70	70	63	54	50	51	—	55	36
12	112	105	105	94	79	77	77	64	84	64
14	156	150	145	131	114	114	117	98	119	100
16	209	200	193	175	159	161	170	142	160	144
18	270	320	310	226	213	216	206	197	207	196

60	3265	3075	2898	2734	—	2704	—	—	2606	3136

Baughman Band Saw

This rule is based on diagrams checked by the author's experience in manufacturing lumber. From the figures given for twelve-foot lengths we may derive the following formula. Board measure equals $.714 [(D-1.1)^2 - 2]$, which allows for a saw kerf of only one-tenth of an inch and a slabbing and edging waste of eighty per cent. of the bark surface. As very few band saws cut a kerf less than one-eighth of an inch, the scale will not hold up for any but a choice run of logs.

International

We have already explained the manner in which this rule is built up but I have, no knowledge of its being tested out for western timber as was the case on white and red pine in an Ottawa vally mill, where it agreed almost exactly with the actual cut.

Baughman Rotary Saw

This rule is used in the middle western states and for small logs

* Consulting Forester for the C.P.R. and a Professor in the Faculty of Forestry, University of Toronto. Mr. Ross is the highest authority on this subject in Canada.

is almost identical with the Champlain rule. Its derived board formula for 12-foot lengths may be written, $B.M. = .6283 [(D - 0.7)^2 - 1]$, which allows for a quarter inch kerf and 60 per cent. of the bark surface for slabs and edging. For an ordinary run of logs this edging allowance is too small, as it permits of a crook of only one inch in twelve feet, but for a saw kerf of three-sixteenths of an inch the scale is fairly satisfactory for logs between six and twenty-eight inches.

Clement

For sixteen-foot log lengths this rule reads "Multiply half the diameter by half the circumference and then subtract half the circumference," which may be written $B.M. = \frac{D}{2} \times \frac{C}{2} - \frac{C}{2}$ and re-

duces to $B.M. = .7854 D (D - 2)$. Its position in our table shows that its scaling score lies between Baughman's Rotary Saw and the Scribner scales.

Scribner

This well known rule was explained and discussed in the comparison of log rules for eastern timber.

Spaulding

This rule was computed from carefully drawn diagrams of logs ranging from ten to ninety-six inches in diameter at the small end and is probably the most accurate for Pacific Coast conditions. For twelve-foot logs its board formula may be written, $B.M. = .5984 [(D - 1.5)^2 - 3]$, which allows five-sixteenths of an inch saw kerf and an average slabbing and edging waste equivalent to the bark surface. This is larger for the small logs than for the medium-sized and large ones and it permits a crook of as much as two inches in twelve feet. In 1878 this rule was adopted as the statute rule of California and is now used in many parts of Washington, Oregon, Utah and Nevada.

Northwestern

From our table it will be noticed that up to eighteen inches the scale of this rule exceeds that of the Lumberman's Favourite and that from twenty to forty-eight inches they are identical, both scales stopping at that diameter.

Lumberman's Favourite

This rule is based on diagrams checked by mill tallies. As it is essentially a composite rule it is impossible to develop a satisfactory formula for all diameters, but, for twelve-foot logs between twelve and twenty-eight inches in diameter it may be written $B.M. = .6981 [(D - 3.08)^2 - 10]$, which indicates a saw kerf of one-eighth of an inch and an enormous allowance for slabbing and edging. Above twenty-eight inches the formula corresponding to the scaling score is $B.M. = .5712 (D - 1.02)^2 - 2$ which allows for a saw kerf of three-eighths of an inch and gives a very satisfactory allowance for slabbing and edging.

British Columbia

This is really a diagram rule based upon drawings showing a slab three-fourths of an inch thick on each of the four sides of the log and a saw kerf of three-eighths of an inch. The drawings were made for logs ranging from twelve inches to seventy-two inches in diameter and all inch boards measuring less than three inches in width were rejected. A study of the figures obtained in this way soon led to the devising of a mathematical formula which is usually written

$$B.M. = \frac{1}{4} \text{ of } \frac{22}{7} (D - 1\frac{1}{2})^2 \times \frac{8}{11} \times \frac{L}{12}$$

which reduces to $\frac{L}{21} (D - 1\frac{1}{2})^2$, where L is the length of the log in feet and D its diameter in inches. The explanation of the part of this formula which is written in brackets, namely $D - 1\frac{1}{2}$, is that three-quarters of an inch should be allowed beneath the bark for "surface waste" which includes slabs and edgings, and consequently reduces the diameter by an inch and a half. It is therefore held that

$$\frac{1}{4} \text{ of } \frac{22}{7} (D - 1\frac{1}{2})^2 \times \frac{8}{12}$$

represents what is left after allowing for the surface waste, and the multiplier $\frac{8}{11}$ is introduced because for each inch board obtained three-

eighths of an inch is lost in the form of sawdust, and $\frac{1}{1 + \frac{3}{8}} = \frac{8}{11}$.

For logs up to forty feet in length it is claimed that the formula $\frac{L}{21} (D - 1\frac{1}{2})^2$ gives fairly accurate results, but for logs over forty

feet in length an allowance is made for taper by increasing the diameter an inch for each ten feet the log exceeds a length of forty feet.

The principal objections to this rule are that with large and small logs having a similar taper (1) the ratio of the bark surface of a large log to its diameter at its small end is less than a similar ratio for a small log, and (2) the volume of a three-quarter inch layer of wood beneath the bark of a large log bears a larger proportion to its bark surface than in the case of a small log. This permits of a larger edging allowance per unit of bark surface for large logs than for smaller ones and results in a tendency to underscale the larger logs and overscale the smaller ones. For saws cutting a three-eighth inch kerf the rule permits of an edging allowance of approximately ninety-two per cent. of the bark surface (which is sufficient to edge boards cut from logs having an average crook of 2.4 inches in 16 feet), and is probably a wider margin than is necessary for western logs but cannot be greatly in excess.

Doyle

We have already explained the derivation of this rule and from both our figures and curves it will be noticed that for logs under nineteen inches in diameter its scale is very much below that of all the other rules. From twenty to twenty-four inches its figures run fairly close to the British Columbia and Northwestern rules, and from twenty-six to forty inches it follows a course intermediate between the British Columbia and International scales.

By plotting the figures given in the above table we get the following set of curves which show even more clearly the relations existing between the different rules.

More stringent regulations than formerly are to be enforced this year in British Columbia to prevent forest fires along railway lines. A recent order published by the railway commission provided for mesh netting over all smokestacks and fireboxes and requires the railway companies to keep inspectors, who must record the condition of these meshes every month and report to the commissioners' engineers. Chief fire inspector will each year submit to the railway companies the measures which will be necessary for fire prevention and the railway companies are ordered to maintain from April to November forces of fire rangers in dangerous districts, these gangs to be under the supervision of the fire inspectors. Another new regulation compels engineers under heavy penalty to report by telegraph to the superintendent at any divisional point the existence of any fires near or upon the right-of-way.

Lumbering Operations at Genoa Bay

Important B. C. Manufacturing Company with Efficient Plant—Equipment for Handling 100 Ft. Timbers—Splendid Harbor Facilities

Genoa Bay, on the east side of Vancouver Island, 36 miles north of Victoria, is the site of the sawmilling plant of the Genoa Bay Lumber Company, Limited, the branch sales office of which is at 618 Trounce avenue, Victoria, B.C. As will be seen from the accompanying illustration, the plant is favored with an excellent natural harbor opening upon Cowichan Bay, which has a good depth of water for large vessels at all stages of tide. This is one of the most important features in connection with a large lumber manufacturing plant. Vessels coming for their loads of lumber can obtain excellent anchorage and the best of shelter. In addition to this, the approach to the harbor from the sea is exceptionally good.

The plant of the Genoa Bay Lumber Company, Limited, is one of the most efficient to be found in Canada. It has a capacity of 125,000 feet in ten hours. The main building of the mill is 300 feet by 40 feet. The proportions of the building are as follows:—engine room, 72 feet x 16 feet; boiler house, 74 feet x 52 feet; planing mill, 80 feet x 48 feet; filing room, 80 feet x 22 feet; machine shop, 200 feet x 22 feet.

The Power Plant

For the production of power, the plant is equipped with four horizontal return tube boilers, 72 inches x 16 feet, built for a working pressure of 132 pounds and supplied by the Victoria Machinery Depot of Victoria, B.C.; one 13 x 16 twin engine driving the head saw; one 24 x 30 slide valve engine driving the main part of the mill; one 12 x 14 high speed engine driving the dynamo. The dynamo is a 25 kw. machine with a capacity for about 600 lights. The machine shop is driven by an electric motor and elevators over the boilers are driven by a small steam engine.

The mill equipment includes a double circular head rig—60 inch saw—4½ inch arbors—Pacific Coast edger—24 inch saws—Wilkins Gang—Berlin Roller Resaw 8 inch saws—Patent Trimmer—Hill Nigger—Twin Engine Feed on carriage—Power Set Works—Steam Cant Flipper to gang—Power Transfer to Edger and the usual complement of live rolls, hand trimmer saws, etc.

Genoa Bay Lumber Company's Mill—View Showing Log Haul-Up.

In the planing mill the equipment consists of a Hoyt matcher, Hoyt four side machine, inside moulder, Stetson Ross ready sizer and Berlin knife grinder. All these machines are piped to a dust collector placed over the boiler house.

The plant also includes a fully equipped lath mill. In the machine shop the equipment includes lathe, drill, press, planer, grinding machine, etc. A fully equipped blacksmith shop is also operated.

The equipment of the mill is such that it can cut up to 100 foot lengths. It is fully equipped for taking care of export business as well as local. The company intend in the near future to build a

In the Heart of Nature—Beautiful Location of the Genoa Bay Lumber Company's Efficient Saw Mill.

ferry slip so that it may make shipments by rail, connecting with the Great Northern Railway and the Canadian Northern Railway.

The Genoa Bay Lumber Company, Limited, is a nexceptionally enterprising concern and is seeking business in every reasonable quarter. They intend to open retail yards at Union Bay on the Saanich Peninsula, connecting with the B. C. Electric Railway running to Victoria, also on Cordova Bay near Victoria. They will ship a large amount of stock to the Victoria market by scows.

The officers of the Genoa Bay Lumber Company, Limited, are as follows:—president, R. T. Elliott, K.C., Victoria; vice-president, D. O. Cameron, Victoria; secretary, J. O. Cameron, Victoria; manager, G. R. Elliott, Genoa Bay.

Prairie Province Trade Conditions

Everything Depends Upon Crop Results — Improvement Expected to Commence this Fall

From practically the commencement of the present year, the prevalent condition in the lumber industry of the prairie provinces has been quietness. At no time however, has the quietness become emphatic. Business, both in the city and rural trade, has been less active than it was last year. There has been a less urgent call for almost all lines of manufactured lumber; sales have been in smaller gross volume; collections in the aggregate, have been less prompt; and trade in general has shown a tendency to fall off. These conditions are still maintained, and there is as yet very little change to report. There is however, a strong feeling of confidence underlying the general inactivity, and existing circumstances are expected to work out to the eventual benefit of the country.

Tight money is the general cry throughout the west at the present time. The banks have adopted a very conservative policy, and all loans are being subjected to close scrutiny. Legitimate and substantial business propositions have only been financed with difficulty, while real estate speculation and all other ventures of an uncertain nature have found difficulty in raising funds. The result has been that sound building propositions in the prairie country have been less this year than they been during recent years, and a good deal less than was anticipated. There is, however, a general feeling that the country will reap the benefit of this period of conservative business, and that the present curtailment of operations will tend to establish a more stable commercial basis.

Crop prospects throughout the west are excellent, and the coming harvest will, if weather conditions continue favorable, be one of the best ever garnered. It is confidently anticipated that as soon as the grain receipts are in general circulation, business will become much more active and money appreciably freer. Those who are most closely in touch with conditions, however, do not anticipate very marked improvement this year. It is thought that the stringency will be maintained for some months, and that it will be early spring before any material change takes place. It is confidently anticipated that when the change does come the whole of the western business world will assume a much healthier tone than for some time past.

In order to obtain an idea of the current conditions and future prospects of the lumber industry of the prairies, a representative of the Canada Lumberman recently visited a number of the leading lumbermen of Winnipeg. These included the heads of manufacturing companies, wholesale and retail businesses and line-yard concerns. The opinions expressed with regard to both current conditions and prospects were remarkably unanimous, differing only in detail and minor points. The following have been selected as representatives of the general sentiment.

All Depends on the Harvest

W. P. Dutton, manager and president of the Great West Lumber Company, takes an optimistic view of the situation. He has just returned from a trip through the prairie provinces, where he has taken particular note of conditions both as regards the crop and the lumber industry. Mr. Dutton thinks that the outlook for both is excellent. "Of course," he said, "I do not anticipate that the harvesting of the grain, however successful that may be, will entirely loosen up money, as most of the proceeds will go towards liquidating debts already contracted, and there will not be a big balance for new building operations. A good deal of the money realized will find its way, indirectly, out of the country, as payment of interest on capital borrowed abroad. But the circulation of the remainder, whether it goes to liquidate debts or to further development, will make a marked difference to the financial situation in the west. We must not look for easy money immediately, and speculative ventures are likely to find difficulty in financing for some time to come. But I am confident that if the harvest fulfills its promise there will be great improvement in business generally, and that a considerably more active trade will be attained."

Referring to the policy of the banks in keeping things tight, Mr.

Dutton thought that this was an excellent line of action. A check was needed, and it was better that such a check should be administered now than later on, when things had gone further and when the country would have felt it the more severely in consequence. It was a salutary measure which would eventually benefit the country. As regards the volume of his own business, Mr. Dutton stated that while there was a decrease in comparison with last year, such decrease was not very marked, and was largely due to the fact that the energies of the organization had been directed more to the matter of collections than to the securing of new business. The policy of curtailed credits and the limiting of the volume of time orders, which had been adopted by lumbermen in general, had reduced the volume of business considerably, especially when taken in conjunction with the financial stringency. In view of these circumstances he thought that the volume of business done both by the Great West Lumber Company and most of the other leading firms during the current season had been very creditable, and that the country generally was standing up under the strain in a remarkable manner. During the months of June and July collections had been very satisfactory, rather better, indeed, than in the corresponding months of the previous year.

A. R. Cavanagh, Winnipeg manager of the Union Lumber Company, remarked upon the present quietness of the lumber industry, but expressed the opinion that, with the prospect of a good harvest, much of which will be cut within the next three weeks, trade in the prairies will soon begin to assume a more hopeful aspect. He looks for a material change in business conditions as soon as the success of the harvest is assured, as the restoration of confidence will induce financial houses to loosen up. Business generally in the lumber industry of the prairies had been considerably lighter this year than last, but the outlook was good for the fall, and heavy business was to be expected next spring. Retail stocks he said, were about normal on the whole.

O. E. Robertson, president of the Union Lumber Company, who visited Winnipeg some weeks ago found market conditions generally somewhat disturbed, but he looks for a good fall trade. Both the Elk and Red Deer mills are running at full capacity, and a cut of from 40 to 50 million feet is anticipated from the two mills for the season.

World-wide Conditions at Work

L. A. Stout, of Stout and McNeill, wholesale lumber dealers, remarked on the severity of the financial stringency, and the current quietness of business. In his opinion, while a successful harvest would increase confidence to a large extent, it would not materially affect the monetary situation. He ascribed the present position to world-wide conditions which will probably continue for some time. The west to-day was largely dependent on outside capital for carrying out the improvements demanded by its rapid growth. Mr. Stout anticipates a continuation of quiet conditions for some little time. The marketing of the crop may alleviate the stringency he believes, but will not dissipate it.

Greater Activity Expected This Fall

H. Galbraith, Winnipeg manager for the British Columbia Mills, Timber and Trading Company, acknowledged the current quietness of trade, but thought that it had been exaggerated in some quarters. There was less business being done than was the case last year. But many people had jumped to the conclusion that this was a bad year, forgetful that 1912 was marked by great activity in all branches of industry, and set a pace which could hardly be maintained constantly. The reluctance of the banks to grant loans had naturally limited the volume of building, and the demand for manufactured lumber, while in addition to this the retailers were not only refraining from pushing business but were buying only from hand-to-mouth. Prices now, were unsteady, mill stocks were heavy, and stocks at retail light. The reduced call for lumber and timber this year on the part of the railway companies was another cause of the smaller volume of business. In view of all these adverse conditions, business on the whole was excellent, and considerably more active than one would expect. While he did not look for any very material betterment this year, he thought that the coming spring should bring with it a very brisk business, provided the harvest is successfully garnered.

Harvey A. Warner, manager of the Imperial Elevator and Lumber Company, spoke optimistically of the situation. The business handled by the yards of the company throughout the prairie provinces had been well up to that during a similar period of last year. Collection on the whole had been very fair, if hardly up to the average, and conditions generally, both as regards his own company and the lumber industry as a whole, were not so bad as many people tried to make out. As to the future, while any prediction must be uncertain, the indications pointed to greater activity during the fall, provided the promise of the harvest was fulfilled, but it will probably be spring, and possibly even the autumn of next year, before any very strong demand could be reasonably expected. In his opinion the mills were rather overstocked, and were inclined to make concessions. Retail stocks were normal.

Utilization of Waste from Sawmills

Methods Already in Use for Converting Sawdust, Edgings, Slabs, Etc., into Commercially Valuable Products—Experiments Indicate New Uses

By James Beveridge*

The waste occurring in our sawmills has become notorious, and the ingenuity of manufacturers and chemists alike has been taxed to the utmost in their attempts to utilize it. Its amount varies greatly in different mills and depends upon the skill of the lumber manufacturer in his endeavors to produce the greatest number of saleable products from the log, and also on the quality and type of machinery he employs for this purpose. But notwithstanding these endeavors there is a certain residue left representing a large percentage of the raw material operated upon, that is considered valueless and unsaleable, and as the accumulation of this material would give rise to a nuisance it is promptly burned. It is this refuse, the production of which is unavoidable, that has engaged the attention of chemists and engineers for many years with a view to convert it into some useful commercial products.

Fuel Value of Sawdust

Classed as a fuel, this refuse, taken direct from the sawmill, ranks low in quality mainly because it seldom contains less than two-fifths of its weight of water and frequently much more, which in substance means that for every three tons of dry fuel burnt at least two tons of water are added to the fire or furnace at the same time. It is usually burnt under conditions of draught, etc., which necessitates the use of a large excess of air. This excess of air together with the presence of so much water, yields a much lower maximum temperature than would be the case were the refuse fuel-wood subjected to a preliminary drying. Besides, the amount of heat rendered latent by the presence of such a large volume of water vapour in the fuel gases, robs the fuel of much of its efficiency. Notwithstanding these facts, however, sawdust and other small refuse form the natural fuel for generating steam in sawmills.

It is somewhat difficult to compute the total amount of refuse produced over the whole country, but the writer considers it cannot, on an average, be less than ten per cent. for sawdust and thirty-three per cent. for slabs and edgings reckoned on the amount of lumber cut. That is to say, for every 1,000 sup. ft. board measure of lumber cut the sawdust produced represents 10 per cent. or 100 sup. feet, and the slabs and edgings 33 per cent. or 330 sup. feet. In other words, the total contents of the log yield substantially 70 per cent. of sawn lumber, 7 per cent. sawdust and 23 per cent. of slabs and edgings. As a general rule two-thirds of a cord of slabs and edgings are produced per 1,000 sup. feet cut, when deals, boards and laths are being manufactured.

The total quantity of lumber of every description manufactured in Canada during 1911 (Forest Products of Canada, 1913) was 4,918,202 thousand sup. feet, board measure, of which the greater proportion consisted of spruce, white pine, Douglas fir, hemlock, red pine, yellow pine and balsam. These together represented nearly 85 per cent. of the total cut. Taking, however, the full cut or total amount of every kind, the sawdust represents at least 491,820 thousand sup. feet, whilst the slabs and edgings are equivalent to 1,639,404 thousand sup. feet.

These figures, it may be remarked, are approximations only, but they are approximations not far from the truth, and serve to show in arithmetical form the enormous amount of waste product our sawmills yield, which must be disposed of in some way or other. This wastage might be minimized by the use of more refined machinery and by multiplying the number of sawn products manufactured. Obviously, a saving of 2½ to 5 per cent. in the sawdust alone means much additional profit to the manufacturer.

Commercial Uses of Sawdust

Sawdust by itself when brought into proper condition can be put to a great number of uses, viz.:—as a cleansing material for metal articles, such as screws; as a packing material for fragile goods; as a stable bedding or absorbent; as a disinfecting powder when impregnated with carbolic acid. Mixed with a suitable binding material it can be moulded into vessels for domestic use, or converted into briquettes for fuel or fire-lighters. Carefully selected as to the proper variety it can be ground to a powder and used as a substitute for cork in the manufacture of cheap linoleums. These are only a few of the many uses to which it can be applied.

The great outlet at the moment for sawdust is its value as a fuel. As above stated, taken fresh from the sawmill, it contains never less than two-thirds of its weight of water. Deprived of this water

by a simple process of drying, waste heat being used for this purpose, the calorific value of one pound is equal to at least one-half pound of good coal; and taking the loss of wood as sawdust to be 10 per cent. of the lumber cut, and the weight of a standard of absolutely dry timber to be 4,500 pounds, by a simple calculation it can be shown that the dried sawdust obtained from every standard of lumber manufactured is substantially equal to 225 pounds of good coal. It would therefore appear that a mill cutting fifty thousand feet per day of ten hours would yield fuel equivalent to 5,625 pounds of coal, or an amount nearly twice that required under modern conditions of working, to yield the necessary power by steam engine to drive the sawmill. But the difficulty in realizing this economy lies in the physical condition of the sawdust itself. When in a dry friable state it is both dangerous and troublesome, and hence it has been suggested to convert it into briquettes before burning. The presses for this are simple and economical, and the union of the particles is aided by the addition of a cheap binding material such as the waste sulphite lye from pulp mills. The fire grate for furning these briquettes should be long, with bars 5/16 of an inch thick and spaced 1/8 of an inch apart.

Gas Production from Sawdust

Recently the use of sawdust for generating gas for gas engines has been applied with marked success in England. This is undoubtedly the most economical method of utilizing this material as a fuel. Its success depends upon the use of the right form of gas producer into which the sawdust is automatically fed in a comparatively dry state and in which it is gradually heated to a state of incandescence before being finally burnt; the products of carbonization, consisting of acetic acid, oils and tan, coming over with the gas. These products of carbonization are carefully separated by cooling, condensation, and finally scrubbing the gas in towers containing coke kept moist with water which may or may not be rendered slightly alkaline, the object being to remove all bodies likely to foul or corrode the valves and parts of the engine with which the explosive mixture comes in contact. The gas obtained is substantially carbonic oxide mixed of course with nitrogen, and although its explosive properties are low compared with producer gas from coal containing a larger proportion of methane and hydrogen, yet the results obtained in actual practice are such as to justify the belief that power generated in this way is comparatively cheap. In virtue of this, there seems to be a great future for such power installations in places where sawdust can be obtained in plentiful supply and at low cost. One of the great advantages in the use of sawdust for the generation of power gas lies in the fact that on combustion in the producer practically no ash or residue is left behind, as is the case with even the finest class of anthracite coal. Assuming 450 pounds of dry sawdust from one standard of lumber cut per hour and two pounds of such wood per horse power hour as the consumption in such a power plant, which is ample for all contingencies, 225 horse power could be generated in this way throughout the ten-hour day. Suction gas power plants are now built guaranteed to consume not more than one pound of anthracite coal per horse power hour. It is generally conceded that in modern sawmills three horse power per hour is required to saw 1,000 sup. feet board measure so that a mill sawing fifty thousand per 10-hour day would require 150 horse power. The sawdust produced in such a mill is obviously sufficient to generate in a gas power plant 526½ horse power, an amount equivalent to nearly four times that actually required for the work of the sawmill.

Chemical Products of Sawdust

Under chemical treatment, the number and variety of primary and secondary chemical products obtained from waste-wood in any form is very numerous. The chemist today is busy experimenting in the laboratory and on a commercial scale with a view to utilizing this material and has already displayed much ingenuity and skill in devising methods and the necessary plant to carry these methods into effect. The problem is a comparatively modern one, but one of very great importance, having regard to the amount of material at his disposal; but although these processes are highly interesting in themselves from a chemical standpoint, yet their usefulness resolves itself into the question whether or not they are commercially possible or profitable. It must be admitted that, so far, many of them are not, but there seems every reason to believe that ere long chemical investigation and experiment will ultimately triumph by pointing out ways and means whereby the manufacture of some at least of the more important chemical products derived from wood can be suc-

*President of the New Brunswick Pulp and Paper Company, Limited, Millerton, N.B.

cessfully manufactured from sawmill waste. A very large proportion of the available material is produced in comparatively confined areas, so that the supply and cost of raw materials for any such process should not be prohibitive.

Paper Pulp From Sawmill Waste

The most important primary product obtained today from sawmill waste is paper-pulp, and it is possible to convert the whole of the waste of every kind into this product by one of the three existing methods known as the sulphite, soda and sulphate processes. The sulphite method was invented in 1866 by the late Mr. B. C. Tilgham of Philadelphia, who in that year took out his English patent. In that patent he laid down the different chemical and mechanical conditions requisite to carry his process into effect, and these conditions are really not seriously altered in the present most modern manufacturing practice. The treatment consists of subjecting the wood in the form of chips to the action of a solution of bisulphite of lime or magnesia or both at a temperature of about 140 deg. C. in specially constructed digesters, whereby the encrusting materials surrounding the fibres, i.e., the lignin and ligno-celluloses, are dissolved, leaving behind the cellulose or fibre. After washing, the fibre is purified by passing through strainers and is then ready for conversion into paper. In this process a series of secondary products is obtained. First, sulpho-compounds of the turpentines are given off during the digesting operation as they are of a highly volatile nature and may be recovered by cooling, and useful products made therefrom by subsequent chemical treatment. Second, the waste sulphite-lye, as it is called, may be concentrated and sold as a tanning agent—the so-called "Spruce Extract" of the tanner; or into the "Gerbleim" of Mitcherlich, the German chemist who has done so much for the sulphite pulp industry in the past; or again into the "Dextrone" of the late C. D. Eckman, a material which has been suggested as a sizing agent; and third, the treatment of these lyes by fermentation and subsequent distillation for the preparation of ethyl alcohol for technical uses. This process originated by Wallin is one of the most modern and deserves a brief description somewhat in detail owing to its great importance, as it, or a modification of it, is likely to be applied extensively in the future to the treatment of waste sulphite lyes. It is well known that when wood is treated at moderately high temperatures with dilute acids, sugars are formed which on subsequent fermentation are converted into alcohol. In this case the dilute acid employed is sulphurous acid, and as this exists in the bisulphites used for reducing the wood to fibre in the digester, the waste sulphite lyes contain the sugars or saccharine bodies ready formed. The hot lye as it comes from the digester is therefore taken and brought into a proper state for the fermentation process by first of all neutralizing the free acid with an alkaline earth such as lime, then aerating by blowing air through it until it reaches a temperature of 30 to 35 deg. C. The clear lye is then subjected to fermentation with the aid of a specially cultivated yeast whereby the sugars are converted into alcohol. Finally the alcohol is separated by distillation. Owing to the large volume of liquors to be treated this process presents many problems which Mr. Wallin, the patentee, has handled in a masterly way, and the plant erected at Kopmanholmen which is producing alcohol of uniform quality daily, and the manner in which the process as a whole is carried out is a tribute to his technical skill and foresight.

The soda and sulphate pulp processes are somewhat identical in principle; both use a form of alkali to dissolve the encrusting materials surrounding the fibre in the wood, the difference being that in the caustic soda method, caustic soda pure and simple is used, whereas in the sulphate method the liquors contain a large proportion of sulphide of sodium. The wood chips and other refuse are acted upon by the alkaline fluid at steam pressures ranging from 100 lbs. to 140 lbs. above atmosphere in steel digesters of large capacity. During the digesting process the turpentine and other volatile oils are given off and may be recovered by condensation when blowing down the steam pressure. Whilst the spent soda liquor separated from the pulp may be subjected to further chemical treatment and a series of chemical products of the resinous class recovered therefrom of more or less importance. As, however, the most valuable material it contains is the soda originally used in the digester; this is recovered for re-use by evaporating the lye to a high density and finally calcining it to an ash in a specially constructed furnace. The fibre is separated from this lye by draining, washed with water till free or nearly so from alkali, and is then ready for conversion into paper. Both of these alkaline processes are especially adapted to the treatment of sawmill waste, more particularly waste from soft woods such as spruce, hemlock, pine, Douglas fir, poplar, etc. The paper known in commerce as "Kraft" is produced by the "sulphate" process from spruce, and is distinguished by its extraordinary strength. It is the strongest wrapping paper in common use, and is now being largely manufactured in Canada.

It is worth noting that, if the 27 per cent. loss of wood in the form of slabs and edgings were converted into Kraft wrapping paper, the commercial value of the paper produced would considerably ex-

ceed the value of the corresponding deals, boards, laths, and all other articles produced in the sawmill from the log. Such a fact as this points to the enormous field which this item alone offers for commercial enterprise, to say nothing of the value of the many secondary chemical products which can be obtained at the same time.

Production of Alcohol

Extensive and very valuable experiments have recently been made by Prof. W. P. Cohoe, of Toronto, in reference to the manufacture of alcohol direct from sawdust. He made use of the well-known fact above mentioned that when wood is heated with dilute acids, as in the sulphite pulp process, sugars are formed which on fermentation are converted into alcohol. He employed hydrochloric acid and found under modified treatment that substantially one-fifth of the sawdust was transformed into sugars which might be converted into alcohol or into refined glucose. These researches open up a wide avenue of possibilities for the production of a cheap alcohol for manufacturers and for power purposes as a substitute for gasoline.

When the waste is classified according to the kind of wood from which it is obtained a long series of chemical products can be secured from it under different modes of treatment. The foregoing, in brief outline, are the most important methods of treating the waste from soft woods on the commercial scale, by processes which are well defined, and commercially possible, and although it is possible to convert certain hard woods such as birch into paper pulp by the soda treatment, yet, this waste in common with other hard wood refuse of large size, is more suitably converted into charcoal and other products by distillation, either with or without the presence of steam at high temperatures. Pine waste obtained in the Southern States may be treated with steam under moderate temperatures and resin oils and turpentine obtained direct from it, whilst the residue can be converted into pulp by the soda process or into charcoal by distillation at high temperatures. Due regard must be paid in all these manufactures to the requirements of trade in respect to the quality of the pulp or paper made, or charcoal and other products of distillation, before adopting any of these processes to specific individual cases. Hard woods, as also poplar and maple, yield a paper pulp possessing distinctive properties very different from that obtained from spruce, balsam and Douglas fir. So also, in the case of dry distillation, the yield and properties of the products obtained vary very greatly according to the temperature employed, its proper control, and the kind of wood treated. The different kinds of wood have been subjected to chemical investigation so thoroughly that no difficulty need be encountered as to what to expect under different systems of treatment.

Treatment of Hardwood Waste

The treatment of birch waste obtained in the manufacture of spool-wood may be taken as typical of the methods applied to hard woods generally. There are two distinct processes for doing this, namely:—destructive distillation and steam distillation. In the former the wood after being dried in the air and of as large a size as possible, is placed in a retort heated from below. The volatile products pass away through a small opening in the retort and are condensed, excepting the gas which flows forward and is used for heating the retort. Besides the gas, three crude products are obtained, (1) charcoal, which remains in the retort; (2) an aqueous liquid known as pyroligneous acid and (3) wood-tar. The liquid products are separately refined by further distillation and two important compounds obtained from them, namely:—crude acetic acid and methyl or wood alcohol. The acetic acid is usually neutralized with lime to form the well-known commercial acetate of lime. The charcoal is used for the manufacture of gun-powder and for the production of the finest grades of iron and in sugar refineries. The wood alcohol is used as a solvent for shellacs, in the production of varnishes, in the manufacture of coal tar dyes, of formaldehyde, and for mixing with grain alcohol to produce "denatured" or "industrial" alcohol.

The steam process of distillation is more applicable to the treatment of yellow pine and consists of heating the wood chips in a retort with either superheated steam at low pressure or with ordinary steam at high pressure. The steam passing through the body of chips carries away with it the turpentines which are condensed in suitable apparatus and further refined. The chips remaining in the retort are used as fuel or converted into paper pulp.

It is obvious that in all these processes, which are of a highly complicated nature it is necessary to employ men of high technical training, involving an adequate knowledge of chemistry and engineering to carry them out in practice, and in view of this there is no likelihood of their immediate application generally to the treatment of sawmill waste. This is a matter of development, but the use of sawdust for generating gas for power plants, its conversion into alcohol for the same purpose and as a solvent, the conversion of slabs and edgings into pulp and paper, and the destructive distillation of hardwood are manufactures well defined and commercially possible today, and it is in this direction that the enterprise of our manufacturers should be directed.

Pulpwood Exports of Quebec Analyzed

U. S. Consul at Quebec in Interesting Interview Presents Facts and Conclusions Regarding an Intricate Problem

The exports of lumber, lath, shingles, pulpwood, etc., to the United States, from the Consular District of Quebec continue to exhibit most interesting features. Recent enquiry made at the consular office at Quebec resulted in the Canada Lumberman securing the following interesting statistics and comments upon the export trade. In the first place, by way of preface, it is interesting to note the course of the export trade during 1912, when it grew in value to \$6,209,423, against \$4,430,329 in 1911. The value of the forest products in 1912 aggregated \$4,817,570 and in 1911 \$3,554,233 a substantial increase of \$1,263,337.

The Increases of Last Year

The following table will show best the increase and decrease for 1911 and 1912 in these exports.

Article	1911	1912
Balsam fir	\$ 2,259	\$ 4,567
Cedar poles		2,035
Clap boards		
Deals	74,822	110,189
Laths	52,696	44,920
Lumber, rough	616,261	1,087,386
Paper, newsprint	211,616	270,081
Pulpwood	1,290,500	1,480,862
Woodpulp	1,273,868	1,807,358
Railroad ties	21,672	10,324
Shingles	10,539	848
Totals	\$3,554,233	\$4,817,570

From this it will be seen, that the most notable increases in 1912 were in the exports of lumber, pulpwood, woodpulp and paper. There is nothing remarkable about the increases of lumber, newsprint and pulp, because these exports are bound to increase from year to year, especially pulp and paper exports, to which reference will be made later; but that the exports of pulpwood should show a gain over 1911 of nearly \$200,000 will surprise those, who have predicted all along, that the restrictions on the exportations of the wood would manifest their effect by reduced exportations.

Mr. Gebhart Willrich, United States Consul at Quebec, referring to this situation said:—"As one who has always combated this idea, I feel endorsed by the returns given, which are probably typical of other export districts. To show further how little the law of supply and demand had been affected by restrictive legislation, I may state, that the results of the first six months of the present year show still greater gains in exports of forest products, and especially of pulpwood, pulp, and newsprint. The table herewith added will show this.

Wood and Manufactures of Wood Exported, January to July		
Article	1912	1913
Balsam fir	\$ 376	\$ 276
Cedar Poles		
Clap boards		
Deals	29,285	11,373
Laths	6,005	13,536
Lumber	224,923	318,208
Paper, newsprint	125,255	350,193
Pulpwood	456,089	561,769
Pulp	571,733	728,617
Railroad ties	3,828	7,350
Shingles	848	
Spruce reels		480
Totals	\$1,418,342	\$1,991,802

"The above table shows, that pulpwood exports have increased and not decreased in 1913, moreover, that the increase was a substantial one, amounting to over \$100,000 in value. For the same six months period in 1910, the wood exports from this district were only \$18,000 more, and that was the year of heaviest exports, because of the fear of an impending shortage, due to restrictions on exportation of wood from Crown Lands.

"The plain facts presented show, therefore, that as much wood has been exported as ever, that the supply is likely to continue equal to the demand, and at fair and reasonable prices, because there is nothing to indicate a material increase in the prices of pulpwood, to judge by valuations of the invoices of shipments sold. There should be some consolation to those, who regret the exportation of any wood from

this and other Provinces of Canada, in the fact, that there is really but little rough wood now being exported, and that most, yes practically all of such exports go either as rossed or peeled wood, thus giving employment to thousands of Canadian laborers, who, during the long winter months, could probably obtain no other labor.

The Demand and Available Supply

"Among the other reasons, why the demand for and exportation of pulpwood in the past, and even now, should not be considered an evil, but rather a blessing, might be mentioned, that many spruce and balsam areas of Canada would have practically no value to speak of, but for the American demand and market for such wood. It takes time to build up home industries of any sort, but it takes much time and much money to build pulp and paper mills, which will be able to afford a home market for all the raw wood material that is available.

"That there has been no such growth of the pulp and paper industry as irresponsible parties have claimed, is readily ascertainable by consulting official sources, and the millions upon millions, said to have been invested in these industries by numerous companies, small and large, according to publications in all sorts of journals, rest on imagination rather than on fact. Nevertheless, there has been substantial progress and growth in that direction in this district, and presumably in other parts of this Province, for several established mills have increased their capacity and several new mills are now in process of construction.

Extensive Pulp and Newsprint Exports

"The pulp and newsprint exports for the first six months of the present year certainly should satisfy the legitimate hopes and aspiration of every Canadian, for they show safe and substantial growth of these home industries. These exports, representing the finished product from the raw wood material now greatly exceed the exports of raw wood. This growth is best shown by the following figures:

	6 months	12 months
Newsprint exports, 1910	\$ 51,616	\$ 173,561
Newsprint exports, 1911	106,791	211,616
Newsprint exports, 1912	125,255	270,081
Newsprint exports, 1913	350,193	
Woodpulp exports, 1910	107,165	765,131
Woodpulp exports, 1911	350,969	1,273,868
Woodpulp exports, 1912	571,733	1,807,358
Woodpulp exports, 1913	728,617	

"A comparison of these exports during the first six months of the years from 1910 to 1913 shows, that the exports of newsprint from this district grew at the rate of 700 per cent., and those of woodpulp at about the same rate, while the volume of the exports of raw wood in 1913 are practically what they were in 1910. All of which figures should be gratifying as an evidence of sound commercial as well as industrial conditions in this Province during these years, which, if left to their natural development and growth, are bound to continue to the lasting advantage of the producers here and consumers abroad.

"Too often the general statement is met with, that the loss to Canada through the sending of pulpwood out of the country in the unmanufactured state is a tremendous one, because if manufactured into pulp and paper, millions of dollars would remain in the country. such statements seem entirely unjustified in the face of the facts, that pulp and paper industries in Canada have greatly increased and have had all the wood they needed at reasonable prices, unaffected by the exportation of same, and that such exportation has been a blessing to the Canadian limit holders, unable otherwise to sell their wood in the home market, and to thousands of woodsmen, who have found steady and profitable work on limits, too far removed as yet from local pulp and paper mills. When Canadian mills shall be ready and willing, at a fair price, to take the raw wood as it ripens from year to year, thus preventing what otherwise would form a dead waste, then, it seems, it would be both just and timely to complain about exportations of raw wood. That time has not come yet."

Death of Alexander Gibson

A recent despatch from Fredericton, N.B., states that Alex. Gibson, one of New Brunswick's pioneer lumbermen, is dangerously ill and fears are entertained that he will not recover. Mr. Gibson is 94 years of age. A despatch of August 14th, announces the death of Mr. Gibson.

Hemlock An Important Trade Factor

**Its Early Struggles Against Prejudice and Its Subsequent Success in
Winning a Good Reputation with the Trade**

By Norman C. Hocken

The man who christened the hemlock tree—although I take some exception to the name selected—exhibited remarkable foresight in his choice. The word "Hemlock," according to my understanding, is derived from the word "Hemleac"; Hem a doubtful meaning and Leac an herb. With such a derivation one might easily expect that the tree bearing this name would have its own troubles in making itself popular on the market. Hemlock has indeed a few marked peculiarities and has likewise experienced great trouble in winning prominence in the lumber industry. Like men who gain their position in life on their own merits however, making success all the pleasanter when obtained, hemlock, on account of its troubles has become a hard fighter. Everyone knows to-day that it is winning its fight. Lumbermen are all remarking the situation and realize that hemlock is gaining favor rapidly. It has won a place of great importance and has come to stay.

Speaking of the peculiarities of hemlock, one is reminded of the fact that its reputation has been affected to some extent upon the belief that it is more characterized by slivers than any other wood. Slivers have been found in hemlock alright, and possibly when it is handled carelessly one may get an occasional sliver in his hands. It is even reported that a man who is not in the lumber business is likely to get slivers in his tongue when pronouncing the word "hemlock."

When Hemlock was Despised

In the palmy days of the good old white pine, hemlock was despised. This was its first and greatest trouble. One may sympathize with the manufacturers of hemlock in this regard, yet one cannot help but appreciate the position taken by our business fathers with reference to it. Their reverence for a monarch of the Canadian woods, the white pine, was more than justified, so long as the monarch existed. It is with regret that one must admit to-day that the reign of the old monarch is past.

The man who christened hemlock was evidently influenced to some extent by the general opinion regarding the tree. He recorded a caution however, as to whether this prejudiced feeling was correct. He seems to have foreseen a wonderful future for this timber. After events have justified this foresight and hemlock has proved that it is well worthy of the position which it has won. Hemlock has come upon our market to stay, as long as any of it is left to offer. It is only a few years ago that hemlock had no real commercial value. Ten years ago it was selling for \$10.50 per M., f.o.b. cars at the mill for No. 1, and it was strictly No. 1 hemlock. No. 2 hemlock had no commercial value at that time. This season No. 1 hemlock is bringing \$21 per M., f.o.b. cars at the mill for 10-foot to 16-foot lengths and higher prices for longer, while No. 2 now has a commercial value and sells at \$16 per M.

Careful Manufacturing Brings Results

One of the chief factors in the improved demand for hemlock is the care and study which have been given to the problems of manufacture. Higher prices for the product have made it possible to devote more attention to this point. Well manufactured lumber of good quality has naturally made a reputation for hemlock, which a few years ago would have been considered impossible. Manufacturers of hemlock to-day are taking particular care to obtain uniform widths, especially in 2 x 4, which is in strong demand on account of its special suitability for studding. Hemlock holds a nail much better than any other soft wood. Better even than the good old white pine or spruce, and besides being better in this regard it costs a little less. Another advantage is the fact that most mills sort out the different widths and lengths in hemlock and are therefore in a position to supply any number of pieces in any size asked for, a fact which makes the stock especially popular with the retailer and builder. Sorting up of this kind is not customary with other woods. One inch hemlock for sheathing cannot be excelled, as it holds a shingle nail much better than any other wood and a roof thus constructed will last longer than a roof of other material. That this fact is fully realized by the trade is evidenced by the good demand for 1-inch hemlock sheathing and the scarcity of stock at the mills. Hemlock is also the most desirable timber for breakwater and wharf construction. The tree grows to just the right size for producing 10-inch x 10-inch and 10-inch x 12-inch timbers which are the two favorite sizes in this work. Spruce and pine are both too expensive and the former is too small in size. Another use for hemlock which is becoming more and more general is for under floors. There is a good demand to-day for 1-inch x 4-inch and 5-inch strips to be used for this

purpose. These facts are quite sufficient to indicate the important position of hemlock in the lumber markets in Canada to-day.

Difficulties of the Early Days

When hemlock was first put upon the market the most serious difficulty which it had to overcome was the low price obtained for the lumber. In order to produce lumber at such a price, the handiest of the timber had to be cut. Even operating in this manner, many firms had to discontinue cutting hemlock, because they could not make it pay. During the last year however, the price has advanced until it has reached a figure which, under former conditions, would have produced a good profit. Unfortunately much of the timber which was cheap to operate has now disappeared and the cost of operation to-day is much greater than it was a few years ago. In fact it is now believed that the belts of hemlock timber are fast approaching their end. One of the factors which make hemlock more expensive to-day than formerly is that the timber has to be peeled in order to float the log satisfactorily. In former days hemlock logs were so close to the mill or to the railroad that this was not necessary.

While we are talking of the cost of production in connection with hemlock, it is important also to consider the cost and efficiency of labor as compared with former days. The cost of labor has increased and, sad to say, the efficiency of labor has greatly decreased. Add to this the high cost of supplies for the lumber camps and one will readily appreciate the fact that those who make a fortune out of manufacturing hemlock to-day are few and far between.

The Future Outlook

Important changes are certain to take place in the lumbering industry in Canada during the next few years. Many manufacturers appreciate this thoroughly to-day and feel that it will be better for them to prolong the operation of their timber over twice the period of time which would be necessary if they continue as in the past, knowing that the latter half of the operations will bring them by far the better results so far as profits are concerned. This applies to the small timber holder as well as the large one. The question of securing timber at right prices after the present supply has been cut out, is one which is occupying the attention of every timber owner and is indeed a most difficult question to solve. Money is high in price to-day. It looks as though the day of cheap money had passed. The future will find lumbering operations carried on at a far larger cost per thousand feet, so I would advise those who think that the price of lumber to-day is exorbitant and that it will soon be lower, to prepare themselves for still higher prices in the future. Possibly some who are connected with the lumber trade may believe that the manufacturer has the best end of the load. To any who feel that way, I would say in conclusion, that we extend a hearty welcome to join us in manufacturing lumber, especially hemlock. If the invitation is accepted he will soon find out that he has been laboring under a great misapprehension.

No Uncertainty About This

In view of the differences of opinion prevailing in New Brunswick, in connection with the Crown Timber Land Policy recently announced by Premier J. K. Fleming, and the divergent opinions which have been expressed by contributors in these columns, the Canada Lumberman recently addressed a letter to the Premier asking him to favor its readers with a statement of the situation from the government's point of view. The reply received from Hon. J. K. Fleming is as follows:—

Editor Canada Lumberman: Your letter re the Crown Timber Land Policy of the Province of New Brunswick is received. In reply may say so far as I know our new policy has given, and is giving, almost complete satisfaction within the Province. The only murmur of complaint whatever, comes from a few men who expected they might convince us that we should grant perpetual leases. Some Government may, in the future, do that, but it won't be one that I will have any connection with. So long as I am in a position of trust and responsibility I shall certainly endeavor to protect the interests of the people, and I can think of no way at this moment in which I would fail more completely and fatally than by handing over the public domain to a few lumber lords forever.—Thanking you for your favor, I remain,

Yours sincerely,
J. K. Fleming.

Ontario Lumber Salesmen

Men Who Keep the Stocks Moving

W. J. MacBeth, Toronto

W. J. MacBeth, Toronto, Ont.

Institute at Toronto. What he gathered at these institutions of learning however, was a secondary matter compared with the information which he commenced early in life to acquire, regarding human nature and business principles. To-day Mr. MacBeth is one of the best posted men in the lumber trade in Ontario.

Enter W. J. MacBeth

Mr. MacBeth's entry into the lumber business was not a matter of chance. He was the son of John MacBeth of Gilford, a sawmiller of considerable renown in his day, who built practically the first steam mill operated north of Toronto. It is interesting to recall that the machinery in this mill was built at Oakville, Ont., in 1852 by Doty and Hibbert, and was transported by team from Oakville north, as there were no railway facilities in those days. The machinery consisted of an English gate saw with a cutting capacity of 3,000 feet per day. It was operated by three men and was considered a marvellous contrivance at that time. The crew operating the mill consisted of a head sawyer, a tail sawyer and a fireman. Even with the small production of this mill, they had no difficulty in turning out each week a car load of band box stock. This was used by C. W. Maltman, of Toronto, for band boxes. A planer took off a strip of one sixty-fourth of an inch which was manufactured into the box. Band boxes manufactured from stock cut in this old mill took first prize at the Centennial exhibition at Philadelphia.

Mr. W. J. MacBeth has devoted the whole of his time, since he was 18 years of age to the lumber business. Prior to that time he spent his holidays and any other spare time he could obtain, around the old mill, packing shingles and making himself generally useful, also obtaining the foundation of that general lumbering knowledge which has been so useful to him in after life. Practically his first experience was in helping the men make roads in the woods. Since that time he has taken a hand in practically everything connected with the lumbering industry from trail tramping and bull-punching to the selling of the finished product.

He was actively engaged in the manufacture of lumber up to 1893. About the year 1881 or '82 Mr. MacBeth's father bought a mill north of Barrie in the township of Medonte and put his son there to look after the manufacturing end of the work. There he remained until 1890. In the meantime he and his brother Charlie took an interest in a lumber yard in Toronto along with Isaac Lennox under the name of Lennox, MacBeths & Company, carrying on a retail lumber and planing mill business. This business went along very successfully until the year 1894 when a bad period of financial depression struck the country and the firm decided to close up rather than attempt to weather the gale. Mr. MacBeth next found employment with the Dixon Lumber Company at Peterboro as a shipper. This position he occupied for about four months, after which he took a position with the Boake Manufacturing Company, Toronto, and remained with them for about a year and a half in the position of general manager.

After leaving the Boake Company, Mr. MacBeth took a try at something new and accepted a position with the A. R. Williams Machinery Company for whom he acted in the capacity of an adjuster and

revivifier of dead accounts. A number of this company's creditors were lumbermen and Mr. MacBeth found his acquaintance with the trade a useful asset in this new work. After he had enough of this he returned to the lumber business, accepting a position with the J. D. Shier Lumber Company, Bracebridge, Ont., as salesman, a position which he occupied for about eight years. Next he entered the employment of the Parry Sound Lumber Company and stayed with them for about seven years as travelling salesman. When the Parry Sound Lumber Company stopped its manufacturing business Mr. MacBeth found a position with the Fesserton Timber Company, Toronto, as sales manager, a position which he still occupies.

A Mine of Information and Reminiscences

It will be seen from this outline of Mr. MacBeth's career that he has had a long and exceptionally varied experience of the lumber business. It is natural that he should be able to tell a great many interesting things about trade in the early days. Some of his reminiscences, as outlined to the Canada Lumberman recently are so exceptionally interesting that we have pleasure in publishing them herewith. Mr. MacBeth has seen a great many changes not only in the personnel of the lumber business, but in the actual conditions surrounding the industry in the city of Toronto. In the year 1879 he opened up the first retail lumber yard west of the railway tracks in Toronto. This was located practically opposite Gwynne Avenue, on Queen Street. This venture was carried out by his father who put W. J. MacBeth in charge.

The Ravages of Time

Speaking of the changes in the personnel of the trade in Toronto, Mr. MacBeth recalled, that there are now only two in business in the retail way in Toronto who were in business at that time namely J. B. Smith and Frank Hillock. So far as wholesalers are concerned he remarked that there is not a solitary wholesale concern to-day in Toronto that was in business at that time, although there are some people in business here who were then in business under different associations.

Equally important and extensive changes have taken place in regard to the prices of lumber. For instance, Mr. MacBeth recalls that the first board side walk laid in Parkdale was of 2 in. x 8 in., 10 in. and 12 in., 16 ft. long in white pine. This lumber was delivered on the different streets by Bryce Bros., for \$8.50 per thousand feet. The grade of this lumber was common and dressing which sells to-day at anywhere from \$27 to \$38. This stock was cut by Dobie & Mercer, at Angus, Ont. Practically similar conditions apply to all other grades of Canadian lumber. Mr. W. J. MacBeth delivered hemlock (No. 1) to J. B. Smith & Sons in 1895 at \$9.50 per thousand feet f.o.b. Toronto. Present prices are in the neighborhood of \$23 to \$24. In 1887 Mr. MacBeth bought 2 in. x 12 in., 12 ft. to 16 ft. clear red oak at \$12 a thousand f.o.b. Hillsdale. The same stock to-day would be worth \$65. In 1883 the prevailing price of white pine saw logs delivered in the mill yard was \$3.50 to \$4 per thousand feet. These logs would run about four to the thousand and had to be all clean body timber. All real and imaginary defects were scaled out. To-day, the same class of logs (if they can be procured) are worth not less than from \$27 to \$28 per thousand feet in the booms where a tug can be hitched on to them. At the mill they would be worth \$30 per thousand feet.

Hemlock's First Appearance

In the year 1871 Mr. MacBeth recollects that there was cut in the old mill at Gilford a quantity of hemlock ties for the Toronto Grey & Bruce Railway. These were shipped to Weston and drawn across by team to Woodbridge. The size of the ties was 5 in. x 8 in. x 7½ in. This was the first hemlock he ever heard of being put to commercial use. The logs cost \$3 a thousand feet delivered in the yards. To-day they would cost \$15.

These are only a few of many interesting recollections that Mr. MacBeth has recounted to the Canada Lumberman from time to time. We hope in future issues to entertain our readers with further reminiscences of a similar nature.

They Must Make the Shingles in Canada

Four carloads of shingle blocks and eight sections of cedar logs were seized recently by the Provincial Government of British Columbia at Crescent, close to the international boundary. The shingle blocks were consigned to a firm at Blaine, Wash., and it is illegal to ship shingle blocks before being made into shingles. Had the blocks been allowed to get over the border they would have been admitted into the States free of duty. Once manufactured into shingles they are dutiable. The officials believe that this has been carried on extensively for some time. All the timber was confiscated; the timber license will probably be withdrawn, and a fine of \$1,000 imposed.

Robert B. Smith, president of the River Valley Lumber Company, Oromocto, N.B., recently sustained a broken ankle when alighting at the office from his motor.

The United States Tariff-its Effect on B. C. Lumber

By C. S. Battle

Should the present United States tariff bill pass the Senate as it has passed the House of Representatives, it will, I think, materially affect the price of standing cedar timber in this province and give a much broader market for cedar shingles, siding, etc.

Along the Pacific coast, cedar timber is scarce except in Washington and British Columbia. It is being cut very fast in Washington and it is only a question of a short time before British Columbia will be furnishing the bulk of the shipments of cedar lumber to the United States, especially if the present tariff bill passes.

Now as to fir lumber, the three states of Washington, Idaho and Montana will ship five times as much common lumber to the Northwest as British Columbia will ship to the States. This condition holds good whether the tariff bill passes or not.

The principal market for British Columbia lumber is in the great Canadian North West, and taking care of our local trade in this immediate section.

For the last few years the local trade has absorbed from forty to fifty per cent. of the output of the mills, but with the money stringency, building will be curtailed and naturally the lumber business will be more or less depressed until we are absolutely assured of a good crop in the Northwest, and also until we feel the effects of easier money in the East and abroad. The mills in British Columbia at this time are producing more lumber than they are selling, and the market is somewhat depressed for these reasons.

In addition to the local and Northwest trade, our export business is increasing year by year. When the Panama Canal is ready for business next year, if the tolls are reasonable it will do more to stimulate the lumber business than anything else. We will then be able to load a ship with lumber of all grades, including culls and shingles, and find a profitable market by shipping to the different points on the Atlantic Coast in the United States and even to points in Canada.

As to standing timber, British Columbia is supposed to contain one-half of the standing saw timber in Canada, but a large quantity of this timber is at present inaccessible and the amount of good available timber is very much over estimated. It is not an easy matter at present to buy good standing timber accessible for logging, at a low or even a reasonable price, as timber is getting into the hands of the larger manufacturing concerns who are able to hold it.

With a few exceptions, the price of timber has not only held its own, but has materially advanced during the last two years. This advance, however, has hardly begun, for British Columbia is no longer considered as the jumping off place of the world or a region populated by Eskimos and polar bears.

Vancouver already has three transcontinental railroads, and three more are building and will be running into Vancouver within the next two years. In addition to this two railroads are building up through Vancouver Island.

The forests of the East and South, including the Southern pine, are being depleted at an alarming rate, and each year brings here an increased number of lumbermen who have cut their holdings in those sections and are looking for standing timber in order that they may continue the manufacture of lumber, that vocation in life which they know and love so well and that they may preserve the spirit of the woodsman which they inherit from their forefathers.

Cowichan Lake Operations Under Way

Work is being initiated in the exploitation of the thousands of acres of timber lands held by the Empire Lumber Company at Cowichan Lake as a result of the presence there of Mr. W. E. Marsh, a prominent official of that concern, whose headquarters are in New York. According to the plans on which the company is working, it will establish as expeditiously as possible one of the largest lumber mills in the Pacific Northwest on a site selected a couple of years ago at Crofton. It was reported recently that several carloads of machinery, to be used in connection with the proposed plant, have already arrived. This, it is stated, is to be utilized in the placing of a portable mill on the company's limits at the lake. This will make it possible to use its own lumber in the construction of the Crofton concern. Only a short time will be taken in these operations, and as soon as they are complete it is expected that tenders will be called for the main mill building. While there has been some delay in getting the enterprise under way, now that it is launched it will go forward, it is authoritatively reported, without interruption. The company is said to have decided upon an aggressive and enterprising policy. Mr. Marsh asserts that it is in a position to carry all that is planned through to a successful conclusion. With the E. & N. branch railway from Duncan to Cowichan Lake, as well as the further extension to the mill site at Crofton, there is no longer any question regarding transportation. As soon as the mill is ready it will be possible to furnish it with the logs required for its operation.

A Life-Long Lumberman

Ottawa Manager for Shepard & Morse

P. C. Walker

One of the best known personalities in the lumber business in the Ottawa Valley is Mr. P. C. Walker, the present manager of the Shepard and Morse Lumber Co. Mr. Walker has had practically a life-long experience in the lumber business. He was born in Hull and started, twenty-three years ago, with the firm of which he is now manager, at the bottom of the ladder, working his way up year by year until at the death of the late Mr. Peter Whelan, in March, 1911, he succeeded to the managership. Prior to that, for eight years he held the position of outside superintendent for the firm. The Shepard & Morse Lumber Company have been operating in Ottawa for over thirty years. Up to the year 1891 they were interested in the lumber business from a wholesale standpoint only, but in that year they purchased their first limits and started a sawmill just outside the city limits of Ottawa. They have a large factory in Burlington, Vermont, a branch office in New York City and head office in Boston, Mass.

P. C. Walker, Ottawa, Ont.

Expansion of Saskatchewan Trade

The annual report of the Department of Agriculture of the province of Saskatchewan which will be published shortly gives the following interesting information regarding the planing mill and lumber manufacturing industries in that province during the year 1912

Planing Mills

	1911	1912
Number of establishments	16	38
Capital, including plant	\$514,443	\$1,331,960
Average capital employed	\$32,152	\$47,570
Number of employees	650	1,008
Total salaries and wages	\$481,584	\$816,984
Average annual earnings per employee	\$740.90	\$810.05
Average number of days worked	251	298
Gross value of product	\$1,391,648	\$2,295,594

The planing mill industry shows the largest general increase, and the statistics, as given above, will need no explanation. Planing mills have been opened during the year at Weyburn, Rosthern, Regina, Saskatoon, North Battleford and Humboldt, among other points. The woodworking industry is one which has rapidly been forging to the front, until it would seem that the home products will within the near future be sufficient to supply the great demand for this line of material. In the year 1911 four woodworking establishments were added to the list of factories in the province as compared with an increase of twelve during 1912.

Lumber Manufacturers

	1911	1912
Number of establishments	15	15
Capital, including plant	\$7,580,000	\$9,957,344
Average capital employed	\$505,400	\$663,882
Number of employees	8,619	9,120
Total salaries and wages	\$3,035,943	\$4,154,812
Average annual earnings per employee	\$351.11	\$475.57
Average number of days worked	287	241
Gross value of product	\$7,512,000	\$7,602,325

Lumber manufacturing is one of the largest and most important of the industries of this province, and, as in the flour milling industry, shows larger capital employed, a larger number of employees, larger wages, etc., but only a small increase in the gross product, this for the reason, as will be seen by the foregoing table, that the number of days on which the mills were in operation, was less than in the previous year. The large increase in the capital invested is due to the large business established at Big River, capitalized at \$2,000,000. This mill had its first full year's operation in 1912. The very small increase in the product is also due to the fact that many of the small and sometimes portable plants in the province were run only for very short seasons.

Top-Lopping in Lumbering Operations

Advantages Secured by Cutting Branches From Tops Left in the Woods
—Fire Risk Reduced—Reproduction Encouraged

By Elwood Wilson

Top-logging is the cutting off of the branches on the top of the tree which is left in the woods by the operator as of no value. After a tree is felled and the logs are cut up, there remains the piece from the end of the last log to the tip of the tree which is too small to utilize and which is left to rot. Naturally, the branches on the under side of this tip hold it up off the ground and those on the upper side stand up in the air, gradually drying out and becoming the most dangerous combustible material and the most difficult in which to fight forest fires. Now it is through no desire of the lumberman to make the woods dangerous that this "slash" is left, but simply because he cannot afford, at present wood prices, to dispose of it in any other way. The trunk of the tree is too small to use and the branches have no value. I am speaking now of conditions in the forests of Canada and the Adirondacks and Michigan, where logs can only be gotten out by driving them down the rivers and where there is no market for firewood. Then too, when these tops are left, reproduction of young trees is often hindered and in growing up through them the young trees become crooked, which diminishes their value later.

In Europe, where there is use for every particle of wood, this question does not arise. All the wood which cannot be sold is gathered up by the poor and used for firewood, even the leaves and needles are gathered up for bedding for farm animals. All branches which are of sufficient size are sold as cord wood and the smaller ones are bundled up and sold as faggots.

In the National Forests of the United States the Government has realized from the first the importance of disposing of this slash and in all wood contracts the purchaser is required to dispose of his slash as the forester in charge shall direct. Some fourteen years ago on a lumber job in Township Forty in the Adirondacks, slash disposal by top-logging was carefully tried and found successful. A commission of State forestry officials and lumbermen visited these cuttings last fall and found that the tops had completely rotted away, that the forest was in good condition and that the natural reproduction was progressing favorably. The report of this commission was so favorable that the New York State Legislature passed a law making the lopping of all tops obligatory on every woods operator. They, however, do not require that tops under three inches in diameter at the last log shall be lopped.

Tops which are not lopped take a long time to decay. In New York State, tops seven years old were found to be still standing up off the ground, a constant fire menace. Here in Quebec I have seen tops five and six years old, still standing up, and a lumber slash of this age almost impassable. On the other hand tops which have been lopped so that they lie close to the ground will entirely disappear in three or four years, adding to the value of the soil and keeping the woods clean and passable.

Costs and Advantages

At a meeting of the State Foresters of the Eastern States, at which were present a number of foresters in railroad and other large work, it was the universal verdict that top-logging was beneficial to the forest and essential as a step for fire prevention. The cost ranged from 25 to 35 cents per thousand feet board measure.

Now lumberman and pulp operators are not anxious to introduce anything into their woods operations which will increase their costs and as long as they feel that top-logging will not directly benefit them and will only make their lumber more expensive they are not likely to undertake it. Those who are more broad-minded and look more to the future, would be handicapped if they introduced it, while their competitors did not. There is only one way in which to introduce it and that is by having a top-logging regulation introduced by the various Provincial Governments. They are the only ones who are interested directly in the preservation of the forest. Since this is made law and enforced on all operators alike, there can be no complaint from any one and a long step will have been taken toward the prevention of disastrous forest fires and toward the improvement of our woodlands.

An Experiment in Quebec

The Laurentide Company, Limited, of Grand Mere, Que., decided to try top-logging on a large scale last winter. The manager of their woodlands department, Mr. M. C. Small has always been on the lookout for better methods and for the improvement of lumbering operations and he laid plans for trying this method of slash disposal over an area of about three square miles. It was somewhat difficult to get the jobbers to undertake this work. They naturally tried to shirk it as much as possible, but in spite of their opposition the experiment

was carried through and was an unqualified success. All the wood in the trees had previously been utilized down to three and one half inches in diameter at the top of the last log, so that the tops left were only about sixteen to twenty feet long, this was the average of thirty-five hundred tops actually measured. The tops were lopped above and below. The branches on the side, which naturally lie flat on the ground, were not in all cases cut off, but they were in a great many.

In looking over these cuttings during July, the first thing that struck the writer was the large amount of wood still being left in these tops. Of course it is absolutely useless as lumber but might be used for pulp by being handled in tumbling barrels and used for the lower grades of pulp. From the standpoint of fire protection there is no question of the success of this experiment. The tops lie close to the ground and have already commenced to decay. The woods are more open and easier to travel through and the sunlight reaches the ground and aids in the reproduction of young trees. The difference between the appearance of forest logged in this way and that cut after the old fashion is so marked that, could it be seen by an operator, he would, I am sure, at once decide to adopt it.

From the forester's standpoint it is certainly a wonderful improvement as it leaves the forest floor in much better condition for seeding and helps to protect the young trees and later to nourish the second crop.

Cost Comparatively Small

The actual cost of this work was thirty-five cents per thousand feet board measure, but we feel sure that after the loggers become accustomed to the work and the inspectors realize that it has come to stay, the cost should be cut to twenty to twenty-five cents per thousand.

It is safe to say that the risk of forest fires assuming dangerous proportions would be cut down fully 50 per cent. by top-logging, that the operation is practical and considering its benefits, well worth the additional expenditure.

St. John Exports of Lumber

Exports of lumber and lumber products for the year ending June 30th, 1913, from the American Consular District of St. John, N.B., according to statistics furnished by the American vice-Consul at that point were valued as follows:—

Product	1912 September	1912 December	1913 March	1913 June	Total
Lumber	\$414,534.40	\$267,308.54	\$159,717.89	\$198,789.59	\$1,040,350.42
Pulp Wood	60,224.88	34,356.25	8,500.00	26,105.01	129,186.14
Wood Pulp	65,967.34	94,681.14	89,482.09	70,494.41	320,624.98
Laths	131,740.39	71,276.44	35,921.75	140,912.17	379,850.75
Ships' Knees	148.90	197.50	1,271.80	463.50	2,081.70
Pine Boards	3,580.10	4,622.87	555.81	1,362.42	10,121.20
Telegraph Poles	1,360.85	226.50	377.31	812.00	2,776.66
Shingles.	10,972.96	5,706.98	982.50	13,743.62	31,406.06
Bark	122.50	122.50
Staves	1,262.50	315.39	1,577.89
Track ties	5,696.56	134.50	5,831.06
Piling	902.50	902.50
Box Shooks	123.50	123.50
Barrel Shooks	606.69	606.69
Total	\$689,914.82	\$484,975.28	\$297,539.34	\$453,132.61	\$1,925,562.05

Increasing Their B. C. Holdings

Mr. J. M. Thompson, President of the Spies-Thompson Lumber Company, of Menominee, Mich., recently visited British Columbia in connection with his timber holdings in that province. In a letter to the "Canada Lumberman" he says:—"We bought out some of the stock holders and the company consists of the following members: J. M. Thompson, president, Menominee, Mich., G. E. Hornibrook, secretary and treasurer, Vancouver, B.C., and James Q. Barcus, Albany, New York. The timber holdings in British Columbia consist of about 50,000,000 feet on Cray Croft Island and 25,000,000 feet on Valdez Island. The company are also considering the purchase of a tract of 100,000,000 feet of very choice cedar and fir. The company's present business consists entirely of logging and selling the logs. Mr. J. M. Thompson is also vice-president of the Hoit Lumber Company, Detroit, Mich. Mr. Hornibrook was formerly with the Wolverine Cedar & Lumber Company, at Webbwood and Little Current, Ontario. Mr. James Q. Barcus is general agent of the Mutual Life Insurance Company of New York and is also interested in several other large contracts of timber.

Modern New Brunswick Sawmill

Up-to-date Equipment and Methods of the Fraser Lumber Co. at Plaster Rock Equal to any on the Continent

Mahony Blower System—Fraser Lumber Co.

Comparatively few people in New Brunswick know much about the extensive business operations which are being carried on at Plaster Rock, yet their importance is great enough to warrant everyone in the province knowing about them and feeling proud of them. One need only go to Plaster Rock and take a look into the great lumber mill of the Fraser Lumber Company, Limited, to realize the truth of this statement. The writer has been into the best mills on the American continent, mills that are thoroughly modern and equipped for cutting from 100,000 to 500,000 feet per day. The large mills of the west had installed band saws in the early 90's and later installed band saws that cut both ways. The writer came back east in 1902 expecting to see a band saw in some part of the province of New Brunswick. But several years have passed and the first band saw seen in New Brunswick was installed by the Fraser Lumber Co. last

spring. At first I was under the erroneous impression that it would be impossible to find men in New Brunswick who could go to the levers and operate the band saw, niggers, steam canters and kickers. But this is being done by them today and they are handling logs on a carriage as easily as an ordinary man would handle a tooth pick. Some of the logs are quarter cut and then sent to a double gang saw for the manufacture of piano sounding boards. Others are sent to the heavy double edgers and re-saws on one side of the mill. The cedar logs are passed on to be made into shingles. Boards, planks, lath and shingles seem to be dropping from every side of the great mill. It is claimed that 140,000 feet of lumber can be manufactured by it in ten hours, with 125,000 shingles and 50,000 lath.

I may add that the yards of the Fraser Lumber Company are as well kept as any I have seen in the west. They take great pride in the sorting and piling of their lumber. It is to be noted that they have acquired the habit of finishing their lumber ready for the market, as is shown by their large new and up-to-date planing mill, which has just been put in operation. This planing mill is equipped with a 200 h.p. Robb engine, high-speed Berlin planers, Mershon resaw and the New Mahony Blower system which delivers the shavings direct from the machines to the fire-room, 300 feet away. This up-to-date blower system operates with the Mahony back pressure valves, which eliminate the necessity for a cyclone or dust collector and is stated to have proved quite satisfactory. The manufacturers claim to obtain fifty per cent. greater efficiency than with the cyclone or dust collector, by the use of these back pressure valves, with a saving of one-third in the power consumption.

The right equipment and the right man at the head of any concern is the secret of success in the lumber business. When the product of such a combination is finished ready for the market it will not be long in finding a buyer. The plant of the Fraser Lumber Co.

is in charge of Mr. H. Tideman, whose ability as a sawmill manager is well known in the eastern provinces. Mr. Archibald Fraser is president and Mr. Donald Fraser general manager of the company.

Ontario Government Studying Timber

A comprehensive report embodying various plans for forest preservation and forest propagation will, it is understood, be in the hands of the Provincial Government in the near future for consideration before the next session of the legislature. It will be prepared by Mr. E. J. Zavitz, provincial director of forestry. Mr. Zavitz has been engaged for some time past in making a study of forest conditions in various parts of the province in order to secure data for his report. He has spent considerable time in the northern districts, and will make further trips in the woods before he begins the task of outlining the situation and recommending a course of action by the government. It is probable that with the report in its possession the Ministry will be in a position to bring down legislation next session dealing with the restrictions upon the cutting of timber in the province, with the protection of young forests, and the use of land unsuited for agriculture for the growing of useful species of trees. The formulation of a general forestry policy will involve many problems, of which one of the largest is that of fire protection. Local conditions would largely govern any scheme for reforestation. It has been suggested that Ontario should make a forest survey similar to that made by Nova Scotia. On the other hand, it is pointed out that the reconnaissance made by the Maritime Province was general in its nature, and did not include precise information on certain points. It has, therefore, been proposed that this province should collate existing information at the outset and then send out parties to make examinations and surveys where they are required.

Saskatchewan Owners Oppose Timber Tax

It is probable that the Saskatchewan government will meet with opposition from the lumbermen in its efforts to collect taxes on timber berths under a measure called the Corporation Taxation Act passed at the last session of the legislature. Recently William E. Hawke, of Melfort, has been appointed timber berth inspector for the province. Under the new act the province proposes to levy a tax on the holdings of lumber companies operating in the province. The question which is likely to be raised by the lumbermen is as to the authority of the province to collect taxes on timber lands in that these are exclusively administered by the Dominion government, and that therefore the province has no jurisdiction. The fight will probably be made principally upon the attempt to collect on unoperated berths, that have already been cut over, but are still held by the companies in the expectation that rigid protection of these from forest fires will result in their again becoming of commercial value through the development of the present small timber. The provincial government estimates that if the Act is enforced it will bring \$65,000 annually into the treasury.

Quebec Cullers' Report

The following comparative statement of timber, measured and culled to date, is furnished by the Supervisor of Cullers' Office, Quebec, P.Q., under date of August 6th:—

	1911	1912	1913
	Cubic Feet	Cubic Feet	Cubic Feet
Waney white pine	483,920	685,320	231,920
White pine	1,720	80	7,560
Red pine	6,360	1,320	960
Oak	44,160	10,280	105,920
Elm	210,000	274,880	194,000
Ash	80	120	1,000
Birch and maple	58,800	38,640	47,680

Fraser Lumber Company's Plant—Plaster Rock, N. B.

Planing Mill—Fraser Lumber Company—Plaster Rock, N. B.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

"American" Fast Feed Matchers

The American Wood Working Machinery Company of Rochester, N.Y., recently sent out an interesting open letter to the Trade, calling attention to their Fast Feed Matcher. Several years ago, the letter says, the company entered into the subject of producing a Fast Feed Matcher, working on practical lines, and they designed a machine to meet the fast feed requirements. The first matcher when completed and thoroughly tested on actual work was placed in operation in one of the largest lumber plants in the country. After thirty days of severe test, the purchasers announced that they were exceptionally well pleased with the machine and that in their opinion it was perfect in every detail. The same company immediately ordered eleven of these machines, notwithstanding that they sell for the highest price that was ever paid for a matcher.

From that day, the demands for this machine have become enormous.

The American Wood Working Machinery Company claim that their model 5 leads not only in speed, but in workmanship and efficiency. Photographs showing the machine in detail will be sent to any who are interested. The "American" model 5 No. 77 Fast Feed Planer and Matcher is equipped with 1913 new features, automatic belt tighteners on both cutter heads ensuring the proper tension of

Toronto Blower Company's Large Contract

The Toronto Blower Company, 126 Duke street, Toronto, have been awarded a large contract for the new plant of the Canadian Locomotive Company, Limited, at Kingston, Ont. This will include a shavings exhaust system and heating plant. The work will be under the personal supervision of Mr. D. Prutsman, the manager of the company. This company have within the past month installed a large buffing and polishing system for the Office Specialty Manufacturing Company in their factory at Newmarket, Ont.

The Clyde Special Messenger

The Clyde Special Messenger, No. 1, which made its appearance on July 31st, recently reached the offices of the Canada Lumberman. This particular messenger devotes itself to an excellent description of the new overhead cableway skidder, manufactured by the Clyde Iron Works, Duluth, Minn. The messenger is in the form of a handy booklet which contains descriptive reading matter and attractive illustrations, all of which give an accurate idea of the appearance, construction and capabilities of this excellent logging machine. The Clyde Special Messenger will be published "whenever necessary." It will certainly be a welcome and useful visitor in the offices of all lumbering companies to whom it is sent.

American Model 5, No. 77, Fast Feed Planer and Matcher.

belts at all times and adding to the life of the belts and the bearings. Among the other valuable features included in this machine, the company call attention to the following:—

Automatic belt release relieving the belts from all strain when not in use.

Cutter head knife jointers, always in position for instant use.

New side head chipbreaker, under the toe of which the shavings cannot escape, and which will not clog.

New top chipbreaker, with removable shoe having a long wearing surface resting flat on the stock.

Patent system of feed roll gearing, simple in construction, dust-proof and running in grease, whereby a strong positive drive is obtained and where intermediate gears or chains and sprockets are not used.

Side clamping boxes with removable babbitted shells and ample means of lubrication.

Quick and accurate adjusting and positive locking matcher legs.

Lower feed roll adjustment on inclines, whereby accuracy and rigidity are obtained.

Adjustable wedge platen—adjustable guides—vertical and parallel adjustment of side spindles made while the machine is in motion. Micrometer adjustment of feed rolls and wedge platen, etc.

The company have issued an illustrated circular in which many other important features of this machine are described. Full particulars may be had by addressing the company.

Maritime Foundry and Machine Works, Limited

Elsewhere in this issue will be found the advertisement of the Maritime Foundry & Machine Works, Limited, of Chatham, N.B., manufacturers of sawmill machinery of all kinds, gangs, rotaries, clap-board planers and machines, lath machines, shingle machines and hoisting engines. The firm enjoy a high reputation for their goods from coast to coast. They are the successors to Alex. Dunbar & Sons, Limited, of Woodstock, N.B., and the Millers Foundry & Machine Works, of Chatham, N.B. Mr. F. H. McNaught, the manager of the former concern, moved to Chatham several years ago and associated himself with Mr. James Miller. Both these men have had wide experience in the manufacture of sawmill machinery and the lines they are turning out are rapidly finding favor with the lumber trade throughout Canada.

B. F. Sturtevant Company Operating Plant at Galt

The B. F. Sturtevant Company of Canada, Limited, have arranged for a plant in Galt, Ont. From this plant the company will handle all business in Canada, and also export to England, Australia, and other foreign countries. The property secured is such that the manufacturing and assembling of the more important lines as manufactured by the B. F. Sturtevant Company of Boston, can be started almost immediately.

Arrangements have been made to provide for a growth up to ten acres of plant, as arranging for this plant and incorporating in Canada means a development of the blower business in Canada by this company on the same large scale as has been accomplished in the

United States by the B. F. Sturtevant Company of Boston. Salesmen are already located to cover Montreal, Toronto and Vancouver sections, and offices will soon be established in each principal city of Canada.

The manufacturing, engineering and sales will be handled by men trained by the B. F. Sturtevant Company of Boston, and the general policy of that company of manufacturing high grade material for the best class of trade will be carried out.

Some of the more important apparatus which will be built are fans, heating and ventilating apparatus, fuel economizers, mechanical draft, steam turbines, vertical engines, generating sets, and stokers.

Edge-Stacking Lumber for the Dry Kiln

Among progressive Canadian lumber manufacturers there has been considerable discussion of late regarding the best method of stacking lumber. The opinion has been gaining ground that stacking lumber flat on the trucks for kiln drying, and stacking it by hand, are

Edge-Stacking Lumber by Machinery—The Curtis Stacker.

primitive and expensive methods, wasteful both of time and kiln space. A number of important modern mills have adopted the plan of machine-stacking the lumber edgewise. By this method, production costs are reduced to a considerable extent. In this connection, we are able to reproduce herewith illustrations of a machine for edge-stacking which has been quite widely adopted and which is worthy of close investigation by mill men who are drying large quantities of lumber.

The machine illustrated is the Curtis Edge Lumber Stacker, built under the original patent of Mr. Robert Fullerton, and is designed for edge-stacking lumber, both parallel and cross-wise of the kiln trucks. The machine is strong, extremely simple, durable, requires no adjusting, and is easily and cheaply installed. The simplicity of the machine is the first thing that strikes one. It is mechanism simplified to its fundamentals—just a hinged frame, raised by a pair of cranks operated by spur frictions, and lowered by a brake, whilst the kiln truck to hold the lumber is held against the machine by weight and cord

tension. Without any skill a man or boy can stack from four to five thousand feet of one and two inch lumber per day.

Mills which have installed this machine report that it affects a considerable saving, because less boiler power is needed for drying, smaller kilns and fewer kiln trucks are required and the grade of the lumber is improved. One company, which has been using three of these machines since 1907, reports that it costs between 20 per cent. and 40 per cent. less to edge-stack their lumber with these machines than to stack them flat by hand. Another user states that on their one stacker, one man and a boy stack from thirty to fifty thousand feet per day, without the machine being worked to anywhere near its full capacity. In fact they state that they could easily put seventy-five thousand feet per day over the machine, without any additional expense.

Lumber when piled edgewise is in its strongest position. Thus only two trucks are required in cases where three would be necessary for the same length lumber if stacked flat. Moreover, it is claimed that the lumber dries much quicker when stacked edgewise and therefore the trucks are available at shorter intervals, meaning fewer trucks and increased mill capacity. One lumber company reports that it can dry one and two-inch edge-stacked lumber in from 8 to 10 hours.

In stacking edgewise, 1-inch by 4-inch piling strips are usually used and the lumber is stacked in solid vertical sheets without air spaces between edges, whereas in flat pilings as large as 1¼-inch piling strips are used and about one-fourth of the horizontal sheet is made up of air space. So it will be seen how it is possible to get more lumber into the kiln.

It is claimed that lumber stacked in this manner comes out of the kiln practically free from warp or check, thereby involving a smaller number of "outs" on the planer. Corresponding saving is effected by the use of the Curtis unstacker for unstacking edge-stacked lumber.

The Curtis & Company Manufacturing Company, of St. Louis, who manufacture the Curtis Edge Lumber Stacker, have compiled considerable data on edge stacking which is at the service of any mill man interested in lowering the cost of his dried lumber. Among the Canadian companies using these stackers are: The British Canadian Lumber Company, Limited, Westminster, B.C., who have four; the Canadian Western Lumber Company, Fraser Mills, B.C., who have eight, and The Vancouver Lumber Company, of Vancouver, B.C., who have two.

A Serviceable Shirt for Loggers

The firm of A. R. Clarke & Company, Limited, of Toronto, which makes a specialty of clothing for loggers, is putting on the market a new model 1913 logger's shirt, which has numerous advantages over other shirts for this special work. In the first place it is made of a

New Logger's Shirt, made by A. R. Clarke & Co., Limited.

very heavy imported wool cloth, which, owing to the nature of the goods, sheds the water like a rubber coat without having the disadvantages which rubber coats have. The arms and shoulders are made all in one piece, there being no seams to rip or let the water in. Also it is the roomiest and most comfortable shirt yet made, embodying the chief characteristics of a shirt, sweater and coat without their inconvenience.

The accompanying cut illustrates this shirt, and its outstanding features should appeal to all intelligent lumbermen.

How the Curtis Edge-Stacker Operates.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch). (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4 1/2 in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

Wanted to Buy

We are in the market to buy the following lumber:

1 carload 1 1/2-in., 1s and 2s, dry quartered Rock Maple, 5-in. and up wide, 8/16 ft. long.

1 carload Rock Elm.
Also Hickory squares, as follows:

100 gross 26-in. x 1 1/2-in. first growth.

1 car 26-in. x 1 1/2-in. second growth.

1 car 26-in. x 1 5/8 x 1 5/8-in. sec. growth.

5 cars plain white Oak, various dimensions, 6-in. and up wide.

2 cars Rock Maple, various dimensions, 6-in. and up, average 9-in.

Rock Maple logs, 20 to 23-in. diameter at small end.

Rock Maple logs, 24 to 30-in. diameter at small end.

White Ash logs, 10 to 18-in. diameter at small end.

State best prices net cash. Delivery to be made as much as possible this season, balance next. Apply P. O. Box No. 1595, Montreal, Que. 16-tf.

Wanted Building Lumber

To sell by active man, middle age, practical experience selling building lumber and hardwoods. Thorough knowledge of credits and collections. Efficient and competent to handle large transactions. Now employed selling in New Jersey and Eastern New York. Want a position offering opportunities for advancement. Address Box 836, Canada Lumberman, Toronto, Ont. 15-16-17-18-19-20

Wanted To Buy

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. t.f.

Trustees Auction Sale of Valuable Timber Limits, known as the McArthur Limits

AUCTION SALE of valuable timber limits in the Province of Quebec, held under License from the Quebec Government. There will be offered for sale by Public Auction at the Russell House in the City of Ottawa, at twelve o'clock noon, on Wednesday the 1st day of October, A.D. 1913, the following timber limits:—

Gatineau Limit

Comprising timber berths numbers 252 to 260 inclusive, located in the district of Montcalm on the Gatineau and Ottawa Rivers, having a total area of four hundred square miles and being located about eighty miles above Maniwaki, the terminus of the Maniwaki Branch of the C. P. R.

These berths are well timbered and well watered, as will appear upon examination of the cruisers' reports below mentioned, and are believed to be among the most valuable timber properties now available.

Lake St. John Limit

Timber berths Numbers 7 and 8, Range 3, north of Lake St. John, situate on the River Alex flowing into the north arm of Lake St. John and containing about forty-five square miles.

Each limit will be offered for sale subject to a reserve bid.

Terms.—Ten per cent. of the purchase money on date of sale and the balance within fifteen days thereafter (without interest), unless otherwise arranged with the vendors.

For particulars and conditions of sale and cruisers' reports and maps of the limits, application may be made to the undersigned solicitors.

Peter Ryan, Toronto,
Auctioneer.

Robertson & MacLennan,
54 Canada Life Building,

Solicitors for Vendors. 16

Timber Limit For Sale

Timber limit in British Columbia containing 138 million feet of merchantable timber. Situated on lake. Timber can be logged to water for between \$4.50 and \$5.50 per M. Will sell all or part on arbitration cruise. Price 75c Per M. on terms will include all hauling machinery already on limits. Reply to Box 839, Canada Lumberman, Toronto, Ont. 15-16

Timber Limit For Sale

Timber limit, including Coal Rights, containing 16 M. feet of Yellow Fir, Cedar, Spruce and White Pine. Situated on Vancouver Island. 12 miles of railroad, locomotives, donkey engines, and complete hauling and logging equipment. Timber under Crown Grant with no royalty. Three million feet of logs in the boom. Accessible situation, favorable logging conditions. Maps, photographs, and cruisers report ready for inspection. Reply to Box 840, Canada Lumberman, Toronto, Ont. 15-16

WANTED

By reliable and experienced logger, contract to take out two million feet of logs or more yearly in good timber. Prefer to start in September. Please state location, average size of logs and full particulars to Box 844, Canada Lumberman, Toronto, Ont. 15

Sawmill For Sale

On Georgian Bay, near Little Current, close to north shore; practically new, well built and equipped with shingle machinery; over one mile of water front, loading dock and sheltered booming ground; plenty of timber available locally or can be rafted in from north shore or Georgian Bay. Good opening for retail store in connection. This is a splendid chance for millman with small capital; price right. Good reason for selling. Great Lakes Lumber Co., Ltd., Owen Sound, Ont. 5-T.F.

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

Miscellaneous**Manufactures Wanted by Town**

Of Blind River. Situated on the Georgian Bay, eighty miles east of Sault Ste. Marie, Ont. Canadian Pacific Railway runs through center of town and within stone's throw of harbor. Abundance of hardwood, spruce, cedar and hemlock within close proximity.

The town is supplied with abundance of electric power from the plant of Mr. F. Deagle, situated at White Falls, near by, and if necessary a great deal more could be generated.

The town has suitable mill site which it is prepared to lease on easy terms to responsible parties, for manufacturing purposes.

For particulars apply to M. F. DYKE, Town Clerk, or F. Y. W. BRATHWAITE, Secretary Board of Trade, Blind River, Ontario, Canada. 14-15-16-17

Timber Limit For Sale

Timber Limit in Province of Alberta, tributary to Saskatchewan River; small area; conveniently situated. Estimate, recent cruise, about eighty million feet, spruce and pine. For price and full particulars, apply Box 820, Canada Lumberman, Toronto, Ont. 13-16

Jointer Accidents

Bulletin No. 2, Volume 4, of the Industrial Commission of Wisconsin, Madison, Wis., is devoted to jointer accidents and their prevention. Speaking of jointer accidents the commissioners said:

Of all the hazards of the wood-working industry, none is so great as the old-fashioned square head jointer or buzzplaner. The annual harvest of fingers and hands in this state alone is appalling. Four out of every 100 accidents in this industry occur on jointers. No other machine on which any number of accidents occurred—with the exception of corn shredders and feed cutters—has caused so many permanent disabilities in proportion to the number of accidents. Of the 77 accidents reported, 44, or 57 per cent., resulted in the loss of one or more fingers. In one case the operator had his entire hand removed. In all, a total of 71 fingers or parts of fingers, and one hand, were cut off by these machines. In four cases 4 fingers were cut off; in two cases, 3 fingers; in eleven cases, 2 fingers, and in twenty-seven cases, 1 finger.

All but two of these accidents occurred on the square headed jointer. In the two instances reported, in which the machines were equipped with safety cylinder heads, the injured person merely suffered a slight abrasion at the tips of his fingers. Germany has long since prohibited the use of this old type of "head." Order 200 of the Industrial Commission reads as follows:—

"All hand jointers must be equipped with safety cylinder heads, and a guard must be placed over the knives to protect the hands of the operator."

If this order had been complied with, it is safe to say, very few of these accidents would have occurred. At least 44 people would today have the use of their fingers, instead of being maimed for life. The safety "head" makes it

impossible for the operator to have his fingers cut off. The cost of installation is comparatively cheap, the average cost being about \$50. According to the compensation payable in some states for the loss of fingers or hands, the amount of money which employers would have to pay for the injuries sustained on jointers would have paid for the installation of new "heads" on over 300 jointers. This guard, with the addition of the guard as required by Order 200, will make employment on these machines comparatively safe.

Fifty-three of the accidents occurred on machines without any sort of a guard. In twenty-two cases the machines had merely the movable wing. Even this guard without a safety head furnishes partial protection to the workmen. Of the twenty-two cases, only 10, or 45 per cent., resulted in serious injury, while of the fifty-three unguarded jointers, 44, or 83 per cent. resulted seriously. In the fifteen months, only two accidents occurred on jointers guarded in compliance with the commission's order. Both accidents caused only slight injuries.

The new ground wood mill of the E. B. Eddy Co., Hull, Que., will be completed in a few weeks. It is up to date in every respect, and is built entirely of steel and concrete. The machinery will be

installed in tiers, and the lighting arrangements are of the best possible character. All the grinders will be operated by individual motors. The company are also making extensive improvements to their power plant.

Canada's imports from the United States during the twelve months ending April 30, 1913, were valued at four hundred and forty-two million two hundred and thirteen thousand three hundred and forty-three, an increase of eighteen per cent. over the same time in 1912 and more than one hundred per cent. over the corresponding twelve months in 1910. Canada's exports to the United States during the same period show an increase of forty per cent. as compared with the preceding year.

Review of Current Trade Conditions

Ontario

A marked improvement has been noticeable in the lumber trade generally during the past few weeks and wholesalers are expressing more optimistic opinions as to the outlook for future business. Many of the retail yards which were fully stocked a short time ago have been shipping out their lumber in considerable quantities, and consequently are now purchasing to replenish their stocks. They seem to be buying with much more confidence than they did in the spring and are also giving substantial orders. The very large building plans arranged by the Toronto Harbor Commissioners will necessitate the use of many million feet of lumber, and this will, of course, be profitable to many wholesalers. There is apparently no let-up in the demand for flooring and boxes of all kinds, many good lines having been reported as being sold to box manufacturers.

Conditions in the United States in the lumber business are reported to be showing improvement and this of course will affect the trade in Ontario favorably.

Business in the intermediate grades of white pine is still very quiet, but culls are still in steady demand. Spruce is selling freely and the demand for hemlock does not seem to have abated to any appreciable extent.

The hardwood market continues brisk, birch being particularly active.

A fairly satisfactory volume of trade is in progress in the local lumber market at North Tonawanda. Prices continue firm and some dealers report a tendency among the better grades to advance in prices. Stocks in the local yards are only moderate and an improved demand is expected in the early fall. Lumber receipts at the Tonawandas during July were quite extensive. The building trade continues fairly active.

Reports from Ottawa state that a slight revival of activity has occurred in the lumber business during the last week or two. The demand from the United States shows some improvement and the trade with Great Britain continues active with an outlook for good business during the balance of the season. Ottawa lumber manufacturers are expected to cut more logs in the woods this winter than usual. J. R. Booth will have twenty camps working by the end of August with 2,500 men, an increase of 1,000 over the number employed last year. Shepard & Morse are sending 500 men to Kippewa. The supply of men for the woods is much larger than usual.

Eastern Canada

The lumber business at St. John, N.B., is practically at a standstill as the mill men's strike has resulted in great scarcity of stocks of rough material. The present indications are that there will be no settlement of the strike this year. Mill owners have found it impossible to advance wages, under present market conditions. The strikers continue to hold out and no work is being done. Building trades as a result are unable to obtain stocks. Although the effect of the strike is so apparent, it is likely to be still greater during the winter. Mill men will not cut any logs in the woods unless the strike comes to an end. Many men will therefore be out of employment during the winter months. Stocks of all kinds are almost cleaned up at the mills.

Markets in the United States are very dull and it is difficult to obtain any reliable quotations. Random cargoes are varying in price from \$20 to \$24, delivered New York. Lath are again easier, being quoted at \$3.75 for 1½ in., delivered New York. Even at this price the demand is almost absent. An easier tendency is reported from the English market, although business continues on quite an active basis. Stocks for the English market are light. High ocean freights however, are keeping down the trade in deals to some extent. A short time ago it looked as though freights would drop, but they are now ten per cent. higher than they were a month ago. Stocks of shingles are low and prices are about 50c. per M. higher than usual at this time of year. The strike has affected the lime kilns, as they now have no wood with which to burn their lime. The rafting season for the St. John Log Driving Company is now over. Their total will not be over fifty-four millions as against one hundred and five millions last year.

Reports from Quebec are to the effect that trade continues very quiet so far as timber is concerned. No important transactions have been reported of late. Shipments of timber and deals are below the average for the year to date. Shipments of deals from lower St. Lawrence to the United Kingdom have continued on a fairly satisfactory basis throughout the season. A fair amount of lumber is being ship-

ped to the South American market. Shipments of pulpwood continue on a large scale.

The local trade at Montreal is largely of a hand-to-mouth character, as no one is inclined to purchase for future requirements. Wholesalers are marking time to some extent, rather than extend credit. Building permits for the month of July show a considerable decrease as compared with July, 1912. For the year to date however, there is a good increase. Trade with the United States is dull. Indications are that the exports to Europe during 1913 will not be as heavy as during 1912. The demand for ground wood is light, although a certain amount of improvement is reported. There is a strong market for sulphite.

A better demand for spruce is reported at New York. Stocks are plentiful and prices are unchanged. The hardwood situation at New York is fairly satisfactory. Stocks are large but the demand has improved. Maple and birch are in good demand. The hemlock trade is quiet at New York. Boards are still scarce and prices are steady. Wholesalers at Boston report an improvement in the demand for spruce. Frames are bringing \$24 to \$24.50, the ruling price being the latter. The demand for random is a little better, but prices are unchanged. Random planed covering boards are steady at \$23. Eastern matched boards are bringing \$25 to \$26. Eastern clipped hemlock is a shade easier at Boston. Some sales being reported at \$23. Random hemlock is steady at \$22. The Boston shingle market is quiet. Extras are selling at \$4 and clears at \$3.75. Red cedars are bringing from \$3.75 to \$3.85. Lath are selling at \$4.30 to \$4.35 for 1½ in., and \$4 for 1½ in.

Great Britain

Encouraging reports still continue from London as to the spot market. The volume of business is fairly satisfactory and prices are on a moderately profitable basis. Arrivals of new goods have been heavy of late and they have been going rapidly overside. These deliveries are likely to make a record during the present year. It is even reported that on account of the pressure for overside deliveries, goods in many cases have been pitched over the ship's side anyhow and a great deal of damage has resulted. The demand continues steady all round. Prices are well maintained and there is no sign of a decline. There seems to be little prospect of prices easing during the present season. Deliveries at London docks for the week ending July 19th, amounted to 13766 standards, as compared with 4,113 standards during the corresponding period of 1912. At Foy, Morgan & Company's recent auction sale some 3 x 6, 10 to 13-foot 1st Quebec spruce brought £14. Another lot of 1st Quebec spruce, 3 x 7 and 8, 10 to 16-foot was sold at £12 15s. A lot of Quebec pine 12 to 16-foot brought £20 for dry 1st and 2nd, 1 x 11 to 15; £22 for 1 x 9 and 10, and £19 for 1 x 7 and 8. St. John spruce 3 x 11, 6 to 19, was sold at £8 10s.

The trade at Liverpool continues quiet, as a result largely of the holiday season. The spruce deal market has felt this more than the other sections of the trade. Prices for future delivery are easier, but this is not looked upon as a general indication of trade conditions. It is thought to be the result of lower freight rates more than anything else. When the cotton season opens, freight room will be diverted from New Brunswick and Nova Scotia and a further decline in deal prices therefore, is not likely.

At Manchester, trade is developing satisfactorily. There is no great rush in the building trade, but everyone appears to be fairly busy. Prices are a little uncertain. Spruce deals have eased slightly in spite of a recent advance of one or two dollars in freight rates and also in the face of the continued strike at St. John, N.B.

United States

Several important conditions are combining in the United States to interfere with the activity of trade. Not the least of these is the extraordinary heat which has prevailed in many sections of late and has interfered with manufacturing operations. The vacation habit is also an important factor and has helped to reduce the general trade activity of the country. In addition to these factors there is no question that business men in general are awaiting the outcome of the tariff revision and currency reform. Manufacturers, wholesalers and retailers are alike affected by this situation and are waiting for knowledge for the exact details before increasing their business undertakings. In addition to these factors, the money market during the present year has been of the utmost importance for the business man's point of view. Tight money has caused a wide spread reduction in production and distribution of manufactured articles. Present indi-

cations are that the money situation is likely to be somewhat easier in the near future. Some relief in fact has already been felt. The great demands of the crop movement, which will shortly be upon us however, must have an important effect in preventing a return to cheap money conditions.

The lumber market, in the face of these conditions is naturally quiet. The total volume of business is much below normal. The fact that mills in general are reducing their output is an encouraging sign. The railroads as usual, are making efforts to improve their equipment for handling the crops and this is leading to a fair amount of activity in car material. Agricultural implement and waggon manufacturers are also enjoying a fair amount of business.

Retail trade continues on a conservative basis, stocks in general being low. It is not likely that a continuation of these conditions will be unprofitable for the retailer. When freight cars commence to be scarce in the fall, retailers who have not kept their stocks up to a

fair average will experience their annual trouble, when they find business offering which they cannot handle. Some lines of lumber are being held so firmly by manufacturers and wholesalers that there is apparently no excuse for expecting a break in prices. Weaker stocks are now so low that they could be purchased to advantage. Most of the signs at present point to an exceptionally favorable opportunity for the retailer to obtain stock.

Northern stocks are being held firmly. Some classes of white pine are being moved with small concessions in order to balance up stock. In a few places hemlock is selling at \$1 or \$2 off the list. A better demand for low grade pine is reported in some markets, especially for box purposes.

Hardwoods continue in a strong position although the demand is not heavy. Oak as usual is the leader. Northern birch is a shade less active than other northern hardwoods. The demand for maple, dry ash and red gum of good grade is strong.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Montreal Market Continues Quiet

Montreal, August 7th (Special to the Canada Lumberman): Although a few wholesalers and retailers are doing good business, inquiries indicate that the bulk of the trade is of a hand to mouth character. A large quantity of lumber is of course being sold, but there is no disposition to purchase ahead of immediate requirements. With the monetary stringency, wholesale firms are inclined to go very slow, preferring to do a smaller business rather than to extend credit.

A fair amount of building is being done, although some projects, for which permits have been taken out, will be held over until next year. For the month of July the total was \$1,565,665, a decrease of \$182,885, as compared with the corresponding month in 1912. For the seven months to date, the permits totalled \$11,497,950, a gain of \$1,683,407 over last year.

Trade with the United States is very slow, and probably this condition will continue until the tariff question is settled.

Present appearances point to a decrease in the shipments to Europe, as compared with 1912. The higher freights and the late start in making exports are the chief factors in this smaller total.

Ground wood still keeps low in price, but there is a little better demand, and it is expected that, by the fall, stocks will have been very largely reduced. Some of the smaller Canadian paper mills have closed down, owing to poor water conditions.

Sulphite is a strong market, there being no surplus stocks available. European advices state that prices are very firm.

Strike Conditions Continuing at St. John

St. John, N.B., August 5th (Special to the Canada Lumberman): Very little, if anything, can be said of the lumber market at this port. Business is at a standstill. The building trades during the past three weeks have been compelled in many instances to cease operations, as it is impossible for them to get stocks of rough material to go on with the building. In fact, trades of all kinds are being badly affected by the mill men's strike, not a mill up to the present time being able to saw a log, and at the present it looks very much as if no settlement will be reached this year, the mill owners finding it impossible under the conditions to advance wages and the operatives standing off and not returning to work.

The effect of this strike will be felt very much more as time goes on. Very few if any logs will be cut in the woods during the coming winter by the St. John mill owners, therefore many men who, all over the valley of the St. John have been employed during the winter, will be without work and be forced to go elsewhere.

Stocks both American and English are about cleaned up from the mills here, and very little work is going on along the waterfront of St. John.

The American market is practically dead and no prices that are accurate can be quoted, for it is not price that is the factor for anyone who is forced to sell there, but where to find a buyer, the price for random cargoes ranges from \$20 to \$24 delivered New York.

Laths have taken a further drop and are to-day quoted for 1 3/8 inch delivered New York \$3.75 per M., with practically no demand at that. The outlook in this market is very indefinite.

The English market is somewhat easier but business is still in first-class condition. Stocks are very light and if it were not for the sudden rise which ocean freights have taken, prices for deals would no doubt improve in the near future. The freight rate has acted very

peculiarly. Everything seemed to point to lower freights, when all at once they have taken a jump and are to-day about 10 per cent. higher than a month ago, whether this condition will keep up is very hard to forecast. Some stocks of English deals are moving by Manchester and London boats, but are largely from interior rotary mills, a great deal being that cut during the past winter. This is now about all cleaned up. J. E. Moore & Company have one steamer loading deals here for the west coast.

Shingles are practically impossible to find. Of course a few are coming from outside the city but only in limited quantities, and the sellers are taking great advantage of the scarcity and prices are about 50c. per M. higher, than at ordinary times.

The lime kilns are all idle, having been forced to close up on account of no wood to burn the lime with. Practically all the lime kilns are supplied by wood from the sawmills and are run in connection therewith.

The St. John River Log Driving Company will finish rafting operations this week. The total amount rafted will not be over 54 million, as against 105 million last season. About all these logs have been towed to St. John and stored in South Bay Booms.

J. E. Moore & Company will start their new mill at South Bay this week.

Ottawa Lumber Trade More Active

Ottawa, August 8th (Special to the Canada Lumberman)—After a period of pronounced dullness, the lumber trade at Ottawa is beginning to pick up again. Even the demand from the United States, which has been particularly dull, has increased during the last few weeks. Trade with England has been fairly good all season and promises to remain steady until the close of navigation on the St. Lawrence.

Lumbermen engaging in the export trade with England are considerably interested in the visit of H. L. Drayton, Chairman of the Railway Commission, to England. He sailed last week for the purpose of taking up the question of ocean freight rates with the British government, with a view to ascertaining if the freight rates charged by steamship lines can be placed under the jurisdiction of the government.

With the opening of navigation this year, practically all the steamship companies plying between Montreal and British ports advanced their rates on all classes of goods. The rate on lumber went up about \$1 per 1,000 feet. It is generally recognized, however, that the Dominion government is powerless to tackle the regulation of the rates alone, neither can it pass a law effecting the matter in any way, for the reason that practically all the ships on the Atlantic are registered in Great Britain. Any action that is taken will have to come from an international board. But the mere fact that the Canadian and the British governments are giving their attention to the question will, it is thought, have a good effect.

Indications are that lumber firms in the Ottawa Valley will cut a good deal more in the woods next winter than they did last. J. R. Booth will have 20 camps working by the end of this month in which will be 2,500 men, a thousand more than he had last year. There are comparatively few logs on the river at present, whereas a year ago the supply was very heavy. J. R. Booth's camps will be located along the Black, Coulogne, Amable du Fond and Montreal rivers.

Shepard and Morse are sending in 500 men to Kippewa and will

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

OF DRY SPRUCE IN CANADA

be working full swing in about two weeks' time. The Pembroke and Colonial Lumber Companies are sending men up to the camps. This year there is no dearth of men, in fact, the supply is much in excess of the demand.

The highest price ever paid for a timber limit to the Ontario government was paid on the 5th inst. when E. A. Dunlop, bought for the Pembroke Lumber Company 15½ square miles of white pine in the Township of Gooderham, District of Nipissing for \$14.40 per thousand. This is \$1.20 higher than J. J. McFadden, of Renfrew, paid for a similar limit about a year ago. The average price paid during the last few years has been between \$10 and \$11.

The City of Hull will have its revenue increased next year by \$25,993 from taxes to be paid by the E. B. Eddy Company. The company was granted a fifteen-year exemption from taxation by the city and this expires at the end of the year. The exemption was granted at the time of the big fire in Hull. The plant is valued at \$2,079,555 and when additions now under way are completed the value will advance about \$500,000.

Whether wood blocks make as good paving for streets as some claim is being discussed in Ottawa. The discussion was promoted as the result of the warping of blocks used to pave Connaught Place, the new thoroughfare in the center of the city. A representative of a New York wood block firm appeared before the board of control and offered to take the members to New York in a special train to show them how well wood paved streets wear.

The new factory and warehouse built on the site of the buildings burned down at the Chamberlain avenue yards of the McAuliffe Davis Lumber Company are now completed and up-to-date machinery is being installed.

Quebec Trade Notes—Timber Business Quiet

Quebec, August 5th (Special to the Canada Lumberman): There is little to report in the lumber trade, as there have been no transactions of importance lately. Shipments of timber and deals from this port are said to be below the average up to date. Shipments of deals from ports of the Lower St. Lawrence to the United Kingdom have been steady since the opening of navigation, while there is a good deal of lumber going to South America.

Pulpwood is being shipped in large quantities and new sources of supply are being examined on the north shore and easterly end of the province. With regard to the shipment of pulpwood, there are now nine steamers regularly engaged for the season conveying wood from the Island of Anticosti to upper lake ports. A few years ago Anticosti was considered useless for any purpose, except for fishermen to land on to dry their fish. Since Menier, the French chocolate king, purchased it, all this has changed, and in a short time pulp will be manufactured there to a considerable extent.

The lumber trade has suffered a great loss in the death of the Hon. John Sharples, senior member of the old and well-known firm of W. & J. Sharples, the oldest house in the timber trade of Canada, which was established here about one hundred years ago. He was held in the highest esteem by all who had the pleasure of his acquaintance in either a business or social manner. General regret is expressed at his death.

Another citizen of Quebec, who was for many years connected with the timber trade of this port was laid to rest to-day, in the person of the late Lieut.-Col. J. Bell Forsyth. The Colonel had been in the timber trade since boyhood, first in the office of his father, and then on his own account. Some years ago he was offered and accepted the position of collector of customs here, which office he held, up to a year ago when he retired. He took a great interest in all matters connected with timber and lumber, and was originator of the well-known J. Bell Forsyth Annual Timber Trades Circular. He was 84 years of age at the time of his death.

Trade Across the Border—Tonawanda Business Notes

North Tonawanda, August 6th (Special to the Canada Lumberman): The adjustment of insurance claims on the lumber burned in the fire at A. Weston & Son's yard in this city on Sunday, July 27, resulted in the payment of \$267,000. Nine million feet of lumber was burned. The Tonawandas have not had so disastrous a fire in ten years. The entire stock of cheaper lumber carried by A. Weston & Son was destroyed. The better grades were piled on the opposite side of the street along the river and were saved with difficulty. Besides the lumber a large shavings shed worth \$5,000 was burned. The planing mill was saved. Preparations were at once begun to restock the yard and the burned lumber will be replaced before the close of navigation. The burned stock was dry as tinder and fanned by a gentle breeze on one of the hottest days of the summer the blaze soon swept everything before it. The total loss was close to \$300,000.

Lumber receipts at the Tonawandas were brisk during July. From present indications receipts will be large the rest of the season, and 1913 will take its place near the top for large receipts. Customs

reports show a total of 45,537,100 feet received last month as compared with 43,537,189 feet during the same month a year ago. To date, a total of 122,692,187 feet of lumber has been brought here from upper lake ports by water. While this is 3,000,000 feet less than the figures for the same period in 1912, lumber already bought and booked for shipment it is said, will more than make up the difference.

The condition of the local market is fairly satisfactory so far as sales are concerned. Orders are steady but indicate a larger volume of business than at the same time last year. Prices obstinately refuse to come down and there is even a tendency on the better grades to stiffen. Local yards are not as well stocked as usual and there is already a well defined tendency to bring in the stock that is certain to be needed as soon as business emerges from the period of vacations, and other mid-summer diversions are passed.

Caleb W. Watkins, one of the pioneer lumbermen of the Niagara Frontier, died to-day at the home of his son in East Liverpool, Ohio. He was particularly well known in the Canadian market.

Building is particularly brisk in the Tonawandas. Indications are that it will continue so, well into the winter. Enlargement of manufacturing plants and the building of new factories together with the large number of homes under construction are the chief reasons.

Quiet Trade Still at New York

Simpson, Clapp & Company, New York, report under date of August 1st as follows:—During the month of July the lumber market passed through a period of pronounced depression; in fact, there was no market at all and prices fell from \$4 to \$5 per M. ft. Retail yards would not buy at any figure and are still holding off until the business situation improves.

There is little or no building going on or contemplated, and, although yard stocks are still low and arrivals this month under normal, desirable schedules have gone begging—price being a secondary consideration with the principal object "A buyer at any figure."

The country's basic conditions, are sound and the outlook should be bright for all business if the administration can accomplish something toward tariff or currency legislation and end this period of uncertainty and hesitation which has depressed general business the country over.

We quote for random spruce cargoes as follows, viz:—narrow and short schedules, \$18 to \$22; long and wide, \$20 to \$24; laths, \$3.75 per M.—demand light.

The Knight Manufacturing and Lumber Co., Ltd.

A progressive and growing concern among the woodworking establishments of Ontario is to be found in the Knight Manufacturing and Lumber Company, Limited, of Meaford. This business has been established for many years but up to a short while ago was catering almost entirely to local trade. About eighteen months ago they first decided to branch out, and to that end the company was made a limited liability company with a capitalization of \$40,000. The capacity of the plant was increased many times and a full line of all the newest machinery necessary for the manufacture of high grade interior finish, sash, doors, etc., was installed. Among the machinery is to be found one of the S. A. Woods latest moulding and matching machines. The manager of this concern, Mr. F. A. Knight, is a young, aggressive business man who has had a thorough experience in the wood-working business. The officers are mostly local men.

The plant is ideally situated in the centre of the town of Meaford, and has both water and steam power, capable of generating up to 150 h.p. One of Sheldon's Limited latest pattern dry kilns of large capacity has recently been installed. The company are now in a position to take care of business in all parts of the country. They are fully equipped to do matching and transit business and the location of their mills gives owners and shippers of lumber on the south shore of the Georgian Bay a splendid opportunity for bringing their stock into Meaford on scows and re-shipping it by train. The mill is located both near the dock and the railway switches. The company are specializing on standard stock work in both soft and hardwoods and have on hand constantly, large quantities of these stocks which can be shipped out at a moment's notice to any part of the country. Sash can be supplied glazed or open and the very closest prices can be given on the former as glass is imported by the company direct from the European markets. With all the latest machinery for the manufacture of these lines and an aggressive organization back of the firm, the Knight Manufacturing and Lumber Company, Limited, should secure a large portion of this growing trade throughout the country.

Recent reports from Vancouver state that a number of forest fires have been reported at various points in British Columbia. Fortunately the forest rangers have been able to cope with the fires so far.

Two Roll Wet Machine "Extra Heavy Design"

Every Pulp Mill Owner Should Investigate

Economy of Stock.

Economy of Labor.

Economy of Power.

Economy of Space.

A Successful Renfrew Lumberman

In our advertising columns will be found the advertisement of Mr. Charles A. Duff of Renfrew, Ontario, who has, for the past eighteen months, been doing a wholesale lumber business from this point. Mr. Duff was formerly in the employ of A. Barnett of that town and has had thirteen years' practical experience in all branches of the lumber business. He deals in both hard and soft woods and also represents the Brunette Saw Mills Company for British Columbia shingles. Beside the wholesale business at Renfrew Mr. Duff in partnership with Mr. H. G. Barnett of Renfrew, took over, last December, the St. Lawrence Lumber and Box Company of South Lancaster, Ontario, who are manufacturers, wholesalers and dealers in timber, lumber, laths, shingles, ties and posts, box shooks, barrel and box headings and cheese box material. There is a saw mill and a box factory at Lancaster, and it is the intention of the present owners to rebuild this fall and erect a modern mill on the site of the present one.

Fire Warnings for New Ontario

"Be Careful With Fire," "If You See a Fire Put It Out," "Put Your Camp Fire Out." Such admonitions as these in flaming red posters are dotting the railway and construction camps of the north country, in the hope of preventing loss and damage by fire. The fire-ranger service of the Department of Lands, Forests and Mines has issued these large posters printed on waterproof linen, to be distributed at important points through the country. Some of the posters are designed for forest reserves, where campers are likely to cause trouble. Others are for construction camps, where workmen are liable to start a fire by the careless throwing away of cigarettes, cigars or matches. Over twenty thousand posters have been sent out this year by the fire rangers, Mr. J. F. Whitson, Road Commissioner, and railway contractors. Next year the quantity will probably be doubled or trebled and the warnings printed in three or four different languages. This year the posters are only in English and French.

Kraft Paper Manufacturing at Millerton

One of the most important industries on the Miramichi river was established in the year 1908 by Mr. James Beveridge, who in May of that year cut the first sod for the erection of the Springfield Paper Mills, near Millerton station on the south-west branch of the river. These mills belong to the New Brunswick Pulp and Paper Company, Limited, and were designed and erected by Mr. Beveridge for the manufacture of what is universally known as "Kraft" wrapping paper. The factory contains a fully equipped pulp plant and two paper machines for the manufacture of "machine finished" and "machine glazed" paper and is capable of producing eighty tons per week. The industry employs about 110 hands and for their accommodation the company has erected suitable cottages and in so doing has established quite a village in the immediate neighbourhood of the mills.

The pulp for the manufacture of this paper is made by what is known as the sulphate soda-process a method which was originated many years ago by Dahl. Since that time many improvements in the process and apparatus employed have been affected in Europe and America and its adoption has been keenly taken up by German, Scandinavian, American and Canadian paper makers. Three large works, turning out 80 to 100 tons a day are in active operation at the moment in the Dominion. This process is particularly adapted for the production of paper from slab wood from sawmills as well as round logs. Both of these forms of raw material are used at Miller-

ton. The product, as the German prefix "Kraft" implies, is exceedingly strong. In fact "Kraft" is the strongest paper made for the wrapping trade, and is admirably adapted for replacing manilla owing to the fact that light weight kraft is stronger and cheaper to use than the best manilla. It can be produced in a variety of colors and with a variety of marks and applied to many other uses besides wrapping—such as the manufacture of bags for provision and dry goods merchants and of envelopes for banks and general commercial work.

These mills at Millerton are the first of their kind in the Maritime Provinces and are the only paper mills in active operation to-day in that part of the country.

Important Information on Lumber Insurance

Elsewhere in this issue, special attention is drawn in our advertising columns to the work of the lumber specializing insurance companies and their field of work in connection with lumber and wood-working risks. There is a great field among the lumber trade for fire prevention and protection, as indicated by the large number of fires which have taken place at Canadian lumber plants during the last few months. The work of the insurance companies in reducing the risk and compensating for the loss in connection with these fires deserves hearty encouragement from all who are interested in the business, particularly because the more effective the protection that is afforded, the less the loss will be, and the greater the benefit to the insuring public who are paying for fire loss.

The Lumber Insurance Company of New York is the only lumber specializing company licensed in Canada. Its Canadian headquarters are at 42 Central Chambers, Ottawa. In addition to this company a number of other reliable companies writing lumber and wood-working risks can be communicated with through the office of the Lumber Insurers General Agency at the same address as above. Any lumberman who is experiencing trouble in connection with his insurance should write to the above office as he is practically certain of securing relief and valuable information from them.

Death of Lieut. Col. J. Bell Forsyth

Quebec, August 4.—Lieut.-Col. J. Bell Forsyth, for many years one of the most prominent and respected citizens of the Ancient Capital, died shortly after midnight this morning after an illness of some length. Until about a year or so ago he had been collector of customs at this port and was known as the publisher of The J. Bell Forsyth Timber circular.

A. E. Cockburn

One of the great necessities in the carrying out of lumbering operations are boats, pointers, winch boats and those equipped with motors for sweeping, towing and driving purposes. Pembroke has a large and modern boat factory of which Mr. A. E. Cockburn is the proprietor. This business was established 50 years ago by the father of the present owner, Mr. John Cockburn, and enjoys a large trade among the different lumber firms in that section. The works have a capacity of 125 boats per year, and are always running their full limit. Mr. Cockburn is a member of the Board of Education and one of Pembroke's most popular citizens.

The marriage took place on August 7th of Mr. Franklin Oliver, of the Oliver Lumber Company of Toronto, Limited, to Miss Ella Esther Owen, of Toronto.

Gordon Development Co. Purchase Climax Locomotive

The Climax Manufacturing Company, of Corry, Pa., are shipping a 45-ton geared locomotive to the Gordon Development Company, of Vancouver, B.C., sold through their Canadian agents, the Vancouver Machinery Depot, Limited, Vancouver, B.C. The Climax Company also has under construction a 30-ton locomotive for the Vancouver Machinery Depot, Limited. This makes four locomotives that this agency has sold in Canada for the Climax Company in the past few months.

New Line of Sawmill Specialties

C. T. Patterson Company, Limited, of New Orleans, La., have just appointed Henry Disston & Sons, of Toronto and Vancouver, as distributors for their sawmill specialties. These include the well-

Zimmerman Patent Wheel Guard and Track Cleaner.

known Zimmerman Patent Wheel Guards and Track Cleaners, and the Improved Coleman Conveyor Cleats.

M. T. Connell, one of the firm's special travelling representatives, is now in Canada and will visit as many of the lumbermen as possible.

We are informed by C. T. Patterson & Company, Limited, that they have already sold over 10,000 sets of the track cleaners to mills in the United States and Canada. They claim that this track cleaner is the only practical device of its kind manufactured.

The company have been manufacturing the conveyor cleats for

the past ten years, and have made such improvements that their No. 10 cleat is considered the acme of efficiency.

Over 10,000 of these cleats have been sold during the past five years. They ensure a clean track, smooth running carriage, hence better running saws and more even lumber. They are made for both flat and V tracks and will be sent on trial to any responsible manufacturer.

E. Long Manufacturing Company Doing Lively Business

The original factory of the E. Long Manufacturing Company, Limited, at Orillia, Ont., was partially destroyed by fire several weeks ago. This building, however, has only been used for the past seven years as a storage warehouse. The fire does not in any way interfere with the manufacture of their well-known machinery for which they are so well and fully equipped in their main building. During the past month this firm have installed circular mills for The Rock Lake Lumber Company, at Dryden, Ontario, and A. T. Hill & Company of Bell River, Ontario, the latter to replace the mill which was destroyed by fire some time ago.

Argall Brothers Again Extending

About two years ago Argall Bros., of Three Rivers, P.Q., took over the business of W. Wallace, who for over 50 years had been a manufacturer of cant hooks, boat hooks, timber dogs, peavies, and other logging supplies. Owing to increased business a new plant was erected twelve months ago, and an extension to this is now being made. Being in the heart of a lumber country, the firm are always on the look out for new ideas so as to improve their particular lines. Argall Bros. also manufacture hand-made log-drivers' boots.

An Unbreakable Trace

The accompanying illustration shows an especially designed trace which the makers, G. L. Griffith & Son, of Stratford, have recently put

Specially Designed Unbreakable Trace.

on the market. It is reinforced with steel cable and is particularly adapted to heavy dray and lumber camp use.

EDGINGS

Ontario

S. R. Hughes, builder and planing mill operator, Toronto, recently suffered loss by fire.

Zeta & Johnston, planing mill operators, Fort Frances, have been succeeded by the Fort Frances Sash and Door Factory.

West & Jackson, Tillsonburg, Ont., are considering the erection of a sawmill at Englehart, Ont. They report that they will be pleased to receive catalogues of machinery and equipment or supplies, also flooring, maple or mixed hardwoods.

The Bay of Quinte Wood Company, Limited, head office Toronto, has been incorporated with capital of \$500,000. Among those interested in the company are C. E. Bailey, 515 Marion street, and A. M. Donovan, barrister, Canada Permanent Building.

The Bay of Quinte Wood Company, Limited, has been incorporated with a capital of \$500,000, to manufacture and deal in timber, lumber and wood of all kinds, with head office at Toronto. The provisional directors are C. E. Bailey, lumberman, A. M. Donovan, barrister, and W. F. Greig, law student, all of Toronto.

The Department of Lands, Forests and Mines has received a tender for damaged timber in Gooderham Township, of the Timiskaming district, along the line of the T. & N. O. Railway. The tender is for \$14.40 per thousand feet, with \$2 per thousand for dues, thus totalling \$16.40 per thousand feet board measure. All the timber is standing.

The Northern Veneer Company, Limited, has been incorporated with a capital of \$200,000, to manufacture and deal in timber, wood, lumber, shingles, woodworking machines and builders' supplies, with head office at Grimsby, Ont. The provisional directors are T. C. Haslett, W. F. McGiverin, and R. C. Ripley, accountants, all of Hamilton, Ont.

The Andrews Lumber Company, Limited, has recently been incorporated with head office at Sault Ste. Marie, Ont., and capital stock of \$150,000. Among those interested are J. R. Andrews and H. R. Andrews, Escanaba, Mich., and John A. McGuire, Ford River, Mich. The objects of the incorporation are to carry on business as lumber merchants and sawmill proprietors.

The directors of the Spanish River Company recently completed arrangements for taking over the plant and property of the Lake Superior Company, and added the following four gentlemen to the directorate to represent the Lake Superior interests as agreed in the amalgamation: W. K. Whigham, of Robert Fleming & Company, London, England; J. Frater Taylor, vice-president of the Lake Superior Corporation, Sault Ste. Marie; W. E. Stavert, Canadian Agency Limited, Montreal; F. S. Szarvasy, managing director, British Foreign and Colonial Corporation, London, England.

The casket manufacturers of Canada have formed an amalgamation under the name of The Dominion Manufacturers, Limited, with head office at Toronto and \$3,000,000 capital. The casket factories embraced in the consolidation are: National Casket Company, Limited, Toronto; the D. W. Thompson Company, Toronto; Semmens & Evel Casket Company, Limited, Hamilton; Globe Casket Company, Limited, London; Semmens & Evel Casket Company (branch) Winnipeg; Jas. S. Elliott & Son, Prescott; Girard & Goden, Three Rivers and Montreal; Christie Bros. & Company, Limited, Amherst, N.S. The officers of the new corporation are: President, Lorne C. Websfer, Montreal; vice-president, Wm. Marshall, Toronto; general manager, T. W. Coles, Globe Casket Company, London; W. J. McConnell, Montreal; A. J. H. Eckardt, Toronto; Mr. Ivey, London; M. Goden, Three Rivers.

The Beaver Lumber Company, Limited, notice of the incorporation of which was published in the Canada Lumberman recently, has its head office at 93 Queen street east, Toronto. The officers of the company are: President, W. Wood, contractor; vice-president, John Repper, merchant; directors, J. M. Bird, lumber merchant; E. Constant, broker; and W. S. Thomas, broker; secretary-treasurer, W. J. Mitchell. The company has taken over the interests of Mr. John M. Bird, who has been trading as the Beaver Lumber Company. The limits consist of 10.3 acres in the township of Proudfoot, about 160 miles northeast of Toronto. The company have in operation a circular mill of 90 h.p. It is estimated that the limits contain 16,215,000 feet of timber, 20,000 cords of spruce pulpwood and 200,000 cords of hardwood charcoal. The capital stock of the company is \$75,000, which is made up of 8,000 of preferred bearing 8 per cent. interest at a par value of \$5 per share and 7,000 profit sharing ordinary shares, bearing 6 per cent. interest also at a par value of \$5 per share.

Eastern Canada

The Sackville Woodworkers, Limited, have sold the plant and site to J. A. Hicks.

The Richford Lumber Company, Sutton, P.Q., has secured provincial registration.

Church & Church, Limited, lumber dealers, Montreal, have secured provincial registration.

Goulet, Premont and Premont, Chateau Richer, P.Q., lumber dealers, are reported to have dissolved their partnership.

F. Pouliat's sawmill at St. Captan D'Armagh, P.Q., was destroyed by fire recently, the loss amounting to \$7,000. The mill will be rebuilt.

The sash and blind factory belonging to Albert M. Wener, on Papineau avenue, Montreal, was recently destroyed by fire. The loss amounts to \$7,000.

The sawmill of the Sidney Lumber Company, Dalhousie, N.B., which

was recently destroyed by fire, will be rebuilt. The manager of the company is Mr. F. McVoy.

The sash and door factory and wood working mill belonging to H. B. Hagan at Charlottetown, P.E.I., was recently destroyed by fire. The loss amounts to \$25,000. There was no insurance.

The sawmill formerly occupied by Damien Lalonde, Limited, St. Lawrence Street, Montreal, has been destroyed by fire. The building was empty, Damien Lalonde having removed all their machinery some months ago to the new mill on Christopher Columbus street. The property was also recently sold.

A report from L'Epiphanie, P.Q., states that the sash and door factory of Ferland Bros. has been destroyed by fire, the damage amounting to \$12,000, with \$2,000 insurance. The flames from the mill were carried across the road by the wind, and set fire to a grocery store and five residences, which were destroyed.

The sawmill, built recently by the Sydney Lumber Company at Dalhousie, N.B., to replace the one destroyed by fire about a year ago, was completely destroyed by fire recently. About sixty men were employed. F. McVoy, the manager, reported that work would soon be commenced upon the erection of a new and larger mill.

N. Sarrasin & Fils, sash and door manufacturers, whose mill was recently destroyed by fire, have decided to rebuild on the old site at 228 Duvernay street, Montreal. The new structure will cost about \$25,000, and will be 80 by 100 feet. It will be of three storeys, built of hollow brick and mill construction, with stone foundations. A sprinkler system will be installed.

The large box factory of the Sable Lumber Company at Wilkins Siding, eighteen miles west of Liverpool, N.S., was destroyed by fire on August 1st, and 300,000 feet of lumber in the factory was destroyed. The fire broke out at one o'clock from some unknown cause, over the boiler room. The flames reached the houses some distance away and reduced eight of them to ruins. The houses were owned by the company and occupied by its men. Estimated loss is \$50,000.

Plans are being prepared for a warehouse on Durocher street, Outremont, P.Q., for the Seaman, Kent Company, Limited, manufacturers of hardwood flooring, who now have premises on the same street. The building, of two storeys, will be on a site 185 x 100, and will be constructed of concrete and brick. The floors will be of hardwood. The warehouse is to be so built as to be capable of being turned into a factory at a later date, and will cost about \$22,000. The C. P. R. are building a spur line for the accommodation of the company.

To finance the new power development at Grand'Mere, P.Q., the dam and power house for which is being built by Mr. H. F. Talbot, the Laurentide Company have issued \$2,400,000 of stock at par to the shareholders. Shareholders had the right to subscribe for one share for every three shares held. The authorized capital is \$10,000,000, and the new issue brings the subscribed capital to within \$400,000 of that amount. The company own 2,200 square miles of timber limits, and draw supplies from another 5,000 square miles. A considerable portion of the electrical power which will be generated will be sold.

The Belgo-Canadian Pulp & Paper Company, Limited, of Shawinigan Falls, P.Q., have decided to erect a sulphite mill having a capacity of fifty tons per twenty-four hours, with necessary buildings so as to permit of an extension of output to one hundred tons every twenty-four hours. The mill will be erected adjacent to the existing ground wood and newspaper mills, and will not be in operation before August, 1914. The ground wood mill is now being enlarged and work will be completed about December. The company are also planning an extension to the paper mill, which will be completed about the end of next year.

Western Canada

The Vancouver Log Company, Limited, has been incorporated with a capital of \$25,000 and head office at Vancouver, B.C.

Fire recently broke out in the shingle mill of Messrs. McGibbon & Hodgson at South Vancouver, B.C., and resulted in damage to the extent of about \$5,000. The insurance carried amounted to about \$4,000.

Fire of incendiary origin broke out in the yard of the Western Canada Lumber Company at Barons, Alta., recently. All the buildings and 200,000 feet of lumber were burned. The total loss was \$15,000, covered by insurance.

Chas. S. Arnold, solicitor for the Crane Company, of Chicago and Vancouver, is taking steps to bring about the sale of the lands of the Ocean Falls Company, Ocean Falls, B.C., to satisfy a judgment for \$20,330.

It is reported that the Big River Lumber Company, Big River, Sask., whose large new mill was destroyed by fire on June 14th will build a number of smaller mills at different points throughout their timber berths instead of building another large mill. No information on the point has yet been given out by the company, however.

The Empire Lumber Company has commenced active operations in the development of its large timber holdings in the Cowichan Lake district on Vancouver Island, B.C. Mr. W. E. Marsh, a prominent official of the company, is now on Vancouver Island, visiting the company's limits. The company intends to erect a large sawmill at Crofton. A portable mill will be erected so that they may use their own lumber in the construction of the large mill.

Kenneth McR. Clark of the force of James W. Sewall, Forester and Surveyor, Old Town, Maine, has recently returned from completing a survey and estimate of timberland in the Northern part of Maine.

Mr. R. R. Williams, former treasurer and travelling salesman for the McAuliffe Davis Lumber Company, Limited, Ottawa, Ontario, has been admitted into partnership in the Williams Lumber Company, 18 Central Chambers, Ottawa.

Are Your Horses Eating Their Heads Off?

ANIMALS must be fed and cared for whether they work or not. When they are feeling right, they will earn their board and keep—when they are not in condition, you CAN'T force them to work. When every ounce of feed is converted into rich, red blood, firm flesh, bone and muscle, there is no chance of your horses eating their heads off and then lying down on the job.

Pratts CONDITION
POWDER

and PRATTS Animal Regulator are the world's best conditioners for horses and cattle. They are mild, natural tonics, acting directly upon the organs of digestion and production. These are strengthened, invigorated and induced to perform their full duties every day. Moreover, animals in perfect condition resist and throw off many diseases which weakened animals readily contract.

Lay in a supply of PRATTS, and be protected against loss and disappointment. Write TODAY for PRATTS "Pointers on Horses." Sent anywhere on receipt of 10c to cover postage, wrapping, etc.

Name

Address

Are Your Horses in Good Condition?

Horses for all lumber work are subjected to the hardest hauling under the most severe conditions. They should therefore be as fit as all possible care and attention can make them.

**In the Lumber Camp,
Around the Mill, In the Yard**

and wherever lumber has to be hauled the horses are always liable to a multitude of small injuries which if not attended to promptly may develop into lameness or disfigurement, thus reducing the working capacity of the horse and impairing its value from a sale standpoint.

You should always have handy and ready for use

Good Liniment

to reduce bruises, strains, soreness; allay pain and inflammation quickly, be an antiseptic dressing to a cut or burn, or to heal a wire cut, wound or laceration.

ABSORBINE

is an antiseptic healing preparation as well as a resolvent and a discutient. It will assist nature in bringing about a dissolution of the bunch, restore the circulation, gradually restoring the part to its normal condition.

It will produce permanent and complete results without blistering or removing the hair, and will leave no blemish. You can work the horse at the same time.

All enquiries on special cases answered without delay—full information and instruction on request. Absorbine \$2.00 per bottle at dealers or express prepaid. Manufactured only by

W. F. Young P. D. F.

MONTREAL, CANADA

DRYING VENEERS

is one of the most important operations of veneer manufacture. The old method of drying in racks is too slow, and requires too much floor space and labor for handling.

THE "PROCTOR" VENEER DRYER

is an evolution of the rack drying method with the disadvantages eliminated. The "Proctor" Dryer is automatic and requires very little floor space, labor, and time for the operation. Veneer is dried by tremendous circulation of warm air.

FIRE INSURANCE

ON LUMBER AND MILL PROPERTY

Fire Prevention

Read these DON'TS

- DON'T** allow refuse, bark or paper to accumulate in alleys or behind piles in the yard.
- DON'T** allow dust or shavings in corners or on the walls of the mill. These spread fire quickly.
- DON'T** allow fire pails to be used for any other purpose. They may be missing when needed.
- DON'T** pile stock around stand pipes and water barrels. This may cause delay when every second counts.
- DON'T** fail to have all bearings examined before closing for the day. Many fires start from this cause after everyone has left.
- DON'T** have oily waste or rags about except in self-closing metal cans. The danger of spontaneous combustion is great.
- DON'T** permit smoking on premises. Light matches, cigars, cigarettes and pipes are dangerous.
- DON'T** harbor that incendiary, the parlor match.
- DON'T** leave inspection of your risk entirely to insurance men. Inspect it yourself. You may discover something that will save a fire.

—They Speak from Experience

*Our Inspections Protect
You Before A Fire*

The Fundamental Theory of Fire insurance RATING Involves the Measurement of Fire Hazard

For many years we have made
A Special Study of the Hazard
affecting Lumber and Wood-
working Plants.

As a result of our experience
We are prepared to demon-
strate our efficiency in reduc-
ing the Fire Hazard in your
risk and at the same time
effect a material saving in the
cost of your insurance.

**We Can Save You Money
We May Save Your
Property**

Fire Protection

Read Policy Conditions

Cease Operations If the property insured is a manu-
facturing establishment and ceases
to operate for more than fifteen con-
secutive days, secure a shut-down permit, or
the policy may be void.

Volatile Oils Storage of gasoline, benzine, and
other inflammables is prohibited in
the Policy; if they must be used or
stored on the premises, secure a permit from
the Company.

Co-Insurance Clause A Co-Insurance Clause attached
to a policy binds the insurer to
carry Insurance up to a certain
percentage of the property value; failure to
carry this amount of Insurance renders the
insurer liable for a portion of his loss. This
item must be watched.

Clear Space The clear space warranty requires an
absolutely clear space between any
woodworking plant and lumber; there
must be no buildings or permanent structures
of any kind in this space; violation of this
clause voids the policy. This needs attention.

Concurrent Forms All Policies covering the same
property must read identically
alike. Examine your Policies and
if any differences exist, have them corrected.
Do this before the fire; corrections cannot be
made afterward.

—They are Important.

*Our Policies Protect
You After A Fire*

WHY you should install the Mahony Blower System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{3}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant.

MOORE'S

Moist Air Dry Kilns

Kilns of the National Steel Car Co., of Hamilton, Canada.

The above is picture of kilns recently built by us for National Steel Car Co., Ltd., Hamilton, Ont. They placed the order with us after investigating the different systems. A recent letter from them reads as follows :

Hamilton, Canada, June 3rd, 1913

L. Moore Dry Kiln Co., Jacksonville, Fla.

Your kilns are doing good work and I am glad you built them. The C.P.R. men were looking at them the other day and thought they were fine.

Basil Magor, Vice-President National Steel Car Co., Ltd.

Battery of Five Moore Moist Air Dry Kilns, with Arch Tile Roof.

This Kiln is the result of 34 years' practical experience. It gives you thoroughly dry lumber, and dries it bright and soft. No case-hardening or checking—Automatic ventilation regulates and retains sufficient moisture to prevent this.

Write us for catalog describing our system.

L. MOORE DRY KILN CO.

Jacksonville, Florida, U. S. A.

What One Of Our Customers Thinks Of Our Blower Systems

The Toronto Blower Co.,
Toronto, Ont.

Gentlemen:

In regard to the installing of one Cyclone and Blower, and connections to the different machines would say, that your work has been very satisfactory and the work performed is we think first-class. The two old Cyclones that formerly gave us trouble on account of throwing out shavings occasionally are now working perfectly, so far, since you made the change in them. We have not discovered once since that they have thrown out shavings as formerly, so on the whole we are very much pleased with your work, and will be glad to give you further work as soon as we make other extensions.

Yours truly,

THE BAIN WAGON CO., LIMITED

John A. Bain
Vice Pres. and Mgr.

WHERE WATEROUS MACHINERY IS BUILT

THIS plant, the present home of the Waterous Engine Works Company, covers thirty acres, and employs five hundred men. In it 60% of the Sawmill Machinery used in Canada to-day has been built.

Up-to-date equipment, honest materials, and progressive manufacturing methods are com-

bined to produce the machinery that is turned out in these shops.

For more than fifty years we have specialized in the manufacture of high grade Canadian Sawmill Machinery. The experience we have acquired in this period is built into our product. Every machine we send out has back of it an organization with a reputation for satisfactory service to sustain, and with the manufacturing facilities and experience to do so. Our prices are reasonable—we guarantee our workmanship.

WHERE WATEROUS MACHINERY IS USED

The mills in the attached list are a few of those which have been entirely equipped with Waterous machinery during the past year.

We are prepared to place at the disposal of our customers an engineering and manufacturing organization founded on fifty years of experience as Sawmill specialists.

We furnish detailed plans and estimates for any sized Sawmill—Circular or Band—and will take charge of the entire construction of the mill and the building and installation of all equipment.

There is a Waterous equipped Mill in your neighborhood—we will be glad to tell you where. Watch our machines at work and ask the operator and the owner what they think of them—then write us for specifications and prices.

HANCHETT

New Hand Lap Grinders

Hanchett Hand Lap Grinder

BUILT IN ALL SIZES

The First Machine Designed Primarily as Hand Lap Grinder. All other lap grinders were designed as Automatic Lap Grinders and transformed to Hand Grinders by leaving off the automatic attachments. In this new lap grinder improvements are secured which greatly shorten the time required to grind a lap besides being more convenient and easier to operate.

We provide an adjustment for raising and lowering the emery-wheel, which is placed at the top of the machine and is controlled by a hand wheel which is under the hand of the operator while he is operating the carriage moving the emery-wheel back and forth across the saw. So that without changing his position or even moving his hand from one adjustment to another, the operator can change the adjustment so as to keep the emery-wheel in contact with the saw as the lap is ground down. In this way there is no time wasted in stopping to change adjustments, and the emery-wheel is kept in constant contact with the saw at any pressure desired. By the same adjustment the emery-wheel is quickly lowered to square the ends of the saw before grinding the lap.

This lap grinder is equipped with our improved saw table adjustment for moving the table out to square the ends of the saw before grinding the lap, or to inspect the lap in course of grinding. This adjustment is positive and will not wear loose. The table is always firmly held in position and perfectly rigid, and yet is easily released to move away from the emery-wheel by less than one-eighth turn of the hand wheel, and clamped at any point for inspecting or squaring the lap, and as easily returned. The pitch and height of the table are easily adjusted to grind a lap of any desired bevel or width.

The emery-wheel carriage runs on rollers so that the emery-wheel is moved back and forth across the saw with very little effort, and is much easier to operate than the ordinary hand lap grinders.

We also provide a hand wheel adjustment for tilting the track or ways on which the emery-wheel carriage runs, to insure that the emery-wheel shall always operate exactly parallel to the saw. This is a new adjustment which most filers who have had experience in grinding laps will appreciate. It insures equal grinding of the lap from end to end.

The improvements embodied in this construction put these machines in a class by themselves, and make the grinding of a lap by hand a very different operation from what it has always been heretofore. When a filer has familiarized himself with this machine we believe that within the time usually required to attach the saw to the older style automatic lap grinders and get the adjustments set ready to start the machine to grinding, he could have the lap practically completed on the new Hanchett Hand Lap Grinder.

HANCHETT SWAGE WORKS

Big Rapids, Mich., U. S. A.

Band Saw Swage

This is our Eccentric Swage for band saws.

Simple, quick and powerful in operation.

Made in three sizes. No. 1, adapted for saws 12 to 16 gauge; No. 2, for 16 gauge or lighter; and No. 3, for 20 gauge and lighter.

When ordering a swage always be careful to state thickness of saws on which swage is to be used, and send sketch of teeth.

A Necessary Part of Your Filing Room Equipment

is a set of good swages for your band and circular saws. But you must be sure they are powerful, durable and efficient—swages that will speed up your work, and at the same time cause you less exertion, while increasing the quality of the results—to be on the safe side, get

DISSTON Eccentric Swages for Band and Circular Saws

They are the self same swages that we use in our own shops. They have been tried and proven the best. They represent today the sum of our long experience in this class of work.

Some Figures on the Saving from Cling-Surface.

For example, take a power plant with engine delivering 100 brake horse power where the belt slips slightly—so little that you think it isn't worth bothering about.

Every per cent of slip on that belt means one horse power lost throughout the year. Sames' Mechanical Engineers' Pocket Book (p. 127) places the cost of power with large compound condensing engines at from 0.8 to 1.0 cent per h.p. hour. If we suppose, in the above plant, that power costs 0.9 cent, which would be low for a 100 h.p. engine, the cost of each per cent of clip on the engine belt per year if the plant operated continually would therefore be \$.009 x 24 x 365 equals \$78.84.

This is by no means an exaggeration but a common loss of which the operator is often unaware, and which summed up for all the slipping belts in a plant can make an astounding figure. Yet Cling-Surface treatment will stop all the slip and its consequent expense at a cost not exceeding a wee small per cent of the saving it effects, and will at the same time keep all belts in prime condition and

waterproofed throughout the longest possible life.

Good belt men get all out of systematic Cling-Surface treatment that is in it. There is neither difficulty in learning how this is done nor in seeing the actual results. Timely and consistent Cling-Surface treatment of any leather, cotton, balata or rubber belts or transmission ropes in lumber mills, etc., invariably saves big money.

Our literature explains this and our liberal offer on a trial order. We quote f.o.b. Toronto.

THE SHIMER CUTTER HEADS

Quality Machine Work

The planing mill man, furniture worker or any one who uses machines to finish wood products, will always find in the Shimer System of Tools the remedy for mill troubles, the power to increase output and the facilities to make a superior product.

No matter whether your work is Single Matching, Double Matching, Ship Lap, Jointing, making Glue Joints or Door and Sash Patterns, if you desire to turn out quality product get the Shimer System in your mill.

Look over this page and then let us have your specifications.

The "Shimer Limited" Cutter Heads, with Expansion, Fig. 627 and Fig. 628.

For the High Speed Matcher

These Heads have a chucking device which self-centers them on the spindle and grips firmly thereto when the device is drawn up, overcoming the objectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speeds.

Price, net, for Flooring, \$72.46 the set complete.

The Shimer Combination Head for Door, Sash, Blinds and Mouldings

The Head illustrated herewith is intended more particularly for the mills which make only a few mouldings or Door and Sash patterns and change work several times a day. Where a mill runs on stock or has much work to do we advise running the Shimer Heads with Circular Bits on account of the greater wear and the fact that the Heads are always ready to be slipped on the spindle.

This particular outfit consists of one Combination Head with one set of Sash Bits, one set of Door Bits, one set of Cope Heads with Door Cope Bits and two Sash Cope Bits for the lower Door Cope Head. The outfit is sent complete for the low price of \$47.31.

The Bits are quickly changed and set to the gauge, when the Door and Cope moulds or the Sash and Cope moulds will match to a nicety. There are no complications to puzzle or annoy operators. As the Bits are moulded on the back at an angle, they work with perfect clearance and maintain standard patterns. Bits can also be adjusted for different thicknesses of Door and Sash mould.

This Head is very strong and durable and with its combinations is applicable to every class of work. It will take Bits to make Door, Sash and various other mouldings and these Bits are quickly and accurately changed and adjusted by the use of a gauge.

We guarantee these tools to be of the best material and workmanship, and will send them on 30 days trial to any responsible lumberman returnable if not satisfactory.

Send measurements at once.

Our Popular Cutter Heads

Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13/16 to 1 1/2-in. in thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench ... \$40.95

Extra Bits for Flooring ... 11.44

Extra Bits for ceiling ... 10.40

With 4 Bits to Each Head.

Jointer Heads

Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15/16 to 1 1/2-in., net only ... \$31.20
Extra Bits 1 1/2-in. face, the set ... 10.40
Extra Bits, 2-in. face, the set ... 12.48

O. G. Batten Heads

Figs. 48 and 49 represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads, complete with Bits, net only ... \$31.98

Extra Bits, each, net ... 2.08

Double Ceiling Heads

Figs. 45 and 46 are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net ... \$40.94
Extra Bits, per set of (8) ... 16.64

Ship Lap Heads

Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices:

Heads with one set of Bits to work 15/16 to 1 1/2-in. thick, net ... \$34.84
Extra set of Bits. ... 11.96

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

DOOR AND SASH HEADS.

Fig. 82, solid flange, Door Head ... \$10.75

Engineers and Machinists

Penetanguishene, Ont., Canada

The "Merit" Line

The production of wood veneer and its many uses has brought about the "Merit" line of machinery which is the result of a life time devoted to this one branch of woodworking machinery. There are three ways to produce veneer. It is cut in a rotary machine by revolving a round log against a knife which feeds forward at each revolution. It is also cut in a slicing machine by passing a squared block or flitch past a screw fed knife, and it is also sawed in a special form of saw mill. The rotary process is the one in most extensive use and is the one for which the "Merit" line has been designed. Rotary cut veneer is produced in walnut, birch, beech, oak, ash, gum and other hard woods for use in the finest class of furniture, piano cases and interior finish. It is also used for drawer bottoms, glass backs and other purposes calling for common grades. In the form of glued-up panels, it has extensive application. Its use in all kinds of boxes, cases, packages and baskets is universal and the consumption increases annually.

The "Merit" Veneer Lathe.

The characteristic features of this machine are the heavy foundation style of frame, cast in one piece, the extra or "third bearing" for the spindle, the use of dogging wheels that "push" instead of "pull" the spindles into the log, the straight line action of the feed screws, the automatic knife pitch adjustment, the patent tilting and quick releasing pressure bar with its whole length pressure regulation by worm and wheel, the "steady rest and extension spindle" for cutting short logs, the simple and compact feed gear mechanism for determining the thickness of veneer, the devices for quick action and large output and the many adjustments for producing the highest results with the least possible skill of the operator.

This machine is made also in the back roll type for special basket and package work. There are three sizes of swing, 52-in., 42-in. and 32-in. and ten lengths of knife, 28, 34, 41, 48, 54, 60, 66, 77, 88 and 100 inches.

The "Merit" Veneer Clippers.

These are machines with reciprocating knives for chopping or clipping long or random widths of veneer into dimension sizes. The No. 277 machine has a long feed table upon which the veneer is piled and carried forward under the knife. A short table beyond the knife is graduated or may carry a gauge to determine the desired width the sheets must be when clipped. This style of machine is used in connection with the rotary cutter in a veneer mill and operates on the green veneer before it goes to the veneer department.

The No. 258 style has short tables on either side of the knife and is mostly used in furniture factories for dimensioning sheets after they are dried.

The No. 233 and 383 foot power clippers are portable machines for light work of the same character.

The No. 234 and 378 are machines with full automatic feed, used in basket, fruit package and crate factories.

Knife Grinders.

The use of automatic knife grinders is almost universal in woodworking mills and they are indispensable in veneer mills. Our line consists of the Style C machine for veneer knives 48, 54, 60, 66, 77, 88, 100 and 110 inches long, and of the style A for knives of all kinds 26, 32, 44 and 54 inches long. All machines have a water attachment for wet grinding.

Log Hoists.

For hoisting and carrying logs from the steam or hot water vats to the veneer lathe, we offer a quick acting hoist of $\frac{1}{2}$, 1, $1\frac{1}{2}$ or 2 ton capacity and trolleys and beams of corresponding capacities.

Clutch Pulleys.

Having our own design of clutch pulley to meet the severe service required in veneer cutting machines, we offer a limited line of sizes to our customers having special use for clutch pulleys. A price list will be furnished on request.

Veneer Knives.

We solicit your orders for veneer and clipper knives and carry a stock of them in the various sizes required by our machines. These knives are of the best quality and are fully guaranteed.

Crate Head Machinery.

For the production of the strongest, lightest and most practical panel crate head, using a tongue and groove cleat, we offer a complete set of three machines, a tenoner, an automatic coupler or framing machine and a cleat sawing machine. The tenoner and coupler are made in two sizes. The No. 1 for heads up to 12 x 20 inches and the No. 2 for heads up to 24 x

36 inches. For utilizing veneer cores and waste lumber, these machines are money makers.

Basket Bottom and Cover Machinery.

In this department there are three machines; a cylinder saw No. 280 for sawing peach basket and hamper round bottoms from boards; a cover or heading rounder No. 356 for rounding basket covers; and a corner rounding machine No. 355 for cornering Climax basket covers and bottoms.

Hoop Machinery.

This is a set of three machines for manufacturing patent sawed hoops. Plank is first ripped into bars on a self feed rip saw. These bars contain material for two hoops and are passed through the Trautman Complete Patent Hoop Machine which planes, points, re-saws and laps the two hoops at one operation. A hoop coiler completes the set and prepares the hoops for market.

Merritt Manufacturing Company

LOCKPORT, N. Y.

MAKERS OF

"Merit" Veneer Machinery

The "Merit" Veneer Lathe

THE FRAME IS RIGHT:

Because—it is substantial and being open at top and sides nothing is in the way of getting in logs.

THE "THIRD BEARING" IS NECESSARY:

Because—nine-tenths of the spindle strain can be and is taken care of by a bushing or short sleeve which is readily replaced at small expense when worn.

THE PRESSURE BAR IS NOVEL:

Because—it has a pressure wheel which regulates the pressure whole length at one; a lever to give the bar a quick drawback movement; adjusting screws to set up each end of the bar independently; set screws and clamping bolts to hold and adjust the steel pressure plate.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

MONTREAL

LOGGING LOCOMOTIVES

BUILT FOR HARD SERVICE

EXACTING demands are made upon logging locomotives. These locomotives, while small must be strong and capable of continuous hard service. Our standard logging locomotives are designed for this service.

They have a minimum number of moving and wearing parts, insuring low upkeep cost. Their short, rigid wheel base makes them suitable for rough and uneven track.

Only tested materials are used in their construction. All wearing parts are made to templates and gauges.

This insures complete interchangeability of all parts on locomotives of the same size and design, and avoids long delays when parts wear out.

MONTREAL LOCOMOTIVE WORKS, LTD.

Dominion Express Building, MONTREAL, CANADA

AROUND THE WORLD

In addition to its success in this country, Dick's Balata Belting is doing notable transmission service in every country on the globe. It is manufactured in Glasgow, has been on the market over 25 years, and has an unbeaten record for long service in hard places.

We are the exclusive Canadian Agents for Dick's Balata Belting.

"Ajax" Loading Chain

Greatest Strength in the Smallest Chain

Above Cut shows a piece of 9-32 inch Chain, proof tested to 3,000 lbs.

Showing the same pulled to destruction, breaking at 7,800 lbs.
(See how this Chain stretched before breaking.)

WELD:

Sectional view showing comparative size of weld and chain.

The stock is overlapped on itself, carrying the lap around over half the length of the link and worked down under the hammer in such a way as to allow a swell in the weld end when finished, and giving a factor of safety not used in ordinary practice. This method of forming the link and building the weld makes the weld the strongest part of the link, as shown in above link which broke at the end opposite the weld end. In ordinary practice Chain invariably breaks in the weld, the lap not extending far enough around and not having sufficient work on the weld to insure equal strength of the material itself.

STOCK:

Our long experience in the manufacture of Chain has taught us that a high grade Chain cannot be made of poor or cheap material, and we are using the best steel obtainable for this Chain, far superior to the Norway iron formerly used for making this grade of Chain, being higher in tensile, tougher and withstanding greater wear.

INSPECTION: We keep inspectors constantly inspecting the manufacture of the Chain at the fires, also prior to and after proof testing, to prevent any Chain leaving the factory which will not come up to our guarantee.

TEST CERTIFICATE:

Every pound of this Chain is proof tested to strains shown in our catalogue and test certificate furnished. Breaks are made often enough to insure quality being maintained.

GUARANTEE: This chain we will guarantee to pull stiff before breaking and every pound will be replaced which does not meet this guarantee. In other words, this is a guarantee that every weld is perfect and that the stock itself is uniform. Users of "Ajax" Chain are always satisfied customers and our friends: and, like all others we desire to increase our friends. Allow us to do so by shipping you "Ajax" Chain.

McKinnon Electric Welded Loading Chain

25% more weld
means
25% more wear

25% more weld
means
25% more strength

The Chain with the Perfect Welds

Size in inches	7/32	1/4	9/32	5/16
Links per foot	16	14	13	12
Weight 100 ft.	60 lb.	80 lb.	90 lb.	110 lb.
Proof test	2200 lb.	2500 lb.	3500 lb.	4500 lb.
Breaking test	4500 lb.	5000 lb.	7000 lb.	9000 lb.

McKinnon Electric Welded Chain is known everywhere by the swell at the weld, secured by strengthening the only possible weak point by the addition of 25% more material, with a resulting increase of 25% in wearing ability and strength. The location of the weld at the side of the link, at the point of least wear, is another exclusive feature. McKinnon chain will pull stiff before breaking and all breaks will develop in the stock, proving the weld to be the strongest part of the link.

The Cost of Lumber Production

can be reduced to the minimum if care is exercised in the selection of the machinery. For years

KNIGHT'S SAW MILL MACHINERY

has been known to lumbermen as the Quality Line that makes for efficiency in lumber production—better lumber at less cost.

The style "S" mill shown herewith is built as a single mill only, and is especially recommended for cutting out small tracts of timber. Its size permits of easy transportation from tract to tract.

Full details of this mill and our entire line is given in our catalog. Write for a copy.

THE KNIGHT MFG. CO., Canton, Ohio.

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

by using our

Patent Steel Band Mill and Carriage

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Write us if interested

Belting That Makes Good

YOU'RE absolutely right! It isn't so much what a belt is, but what it has done for others in your line of work, and how closely the maker stands behind his belt till it does "make good."

This is the plan that sells Leviathan Belting.

Main Belting Company

MONTREAL of Canada, Limited CANADA

Knowledge Essential To Comparison

To the uninformed a few gnarled, stunted trees, feathered to the ground may appear as a magnificent forest. The uninformed have no standard for comparison.

Have you?

Are you familiar with forest growth in redwood, sugar pine, western pine, fir, spruce, cedar, with the white pine of the north, the longleaf and shortleaf pines of the south, with the hardwood forests of all sections?

Possessing this knowledge you are qualified to compare values. Not possessing it you need the service of someone who is informed to serve as your agent whether you contemplate buying or selling.

We learned in the great school of practical work, have studied the business for thirty-five years and are studying harder than ever to-day.

Our corps of timber experts is at your service.

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

Four Inch Steam Set Works

Will increase the capacity of your mill

Because it lightens the work of your setter, making it possible for him to put through more logs every day.

Because quicker work is possible with it than with a hand operated machine.

Because it will set up to 4 inches with each throw of the lever instead of only 2 inches which is the limit of most hand operated set works.

These are some of the reasons why several operators have increased their cut over 2,000 feet per day. You can do as well.

Send for catalogue L-6.

William Hamilton Company
Peterborough, Ontario

SPARTAN BELTING

*Dominant in the Field
of Hard Service*

Spartan Belting like the Spartan men of old is intensely strong and durable, resisting absolutely those abnormal conditions which rapidly ruin ordinary belting.

Planers and matchers that eat up lumber at the rate of 200 to 300 lineal feet per minute demand the maximum efficiency in belting equipment.

Spartan Leather Belting

is built especially for those high speed drives. It stands hard service on small pulleys because of its unusual flexibility which ensures a firm and instantaneous grip.

We guarantee that **Spartan Belting** when used under the same conditions will transmit more power and with greater economy than any other form of transmission.

Send for Spartan Book and our Text Book the Care of Belting. Both are free and sent by return mail.

White Trucks in the Lumber Industry

IN all branches of the lumber industry as in other lines of business, White Trucks are the trucks selected by concerns who are best informed regarding the merits of the various makes of motor trucks.

For the Producer—White 5-ton Logging Truck with power-driven mechanism for loading and unloading

White 5-ton Truck for general hauling

FROM the first step of bringing the logs from the forest to the mill, to the final distribution of products made from lumber, there is a White Truck which will do the hauling involved with greater efficiency and economy than any other method.

White $\frac{3}{4}$ -ton and $1\frac{1}{2}$ -ton trucks are designed primarily for delivery work. These trucks are used to great advantage by lumber mills and dealers for the delivery of mill products and enable the user to give service to customers which competitors cannot equal unless they are similarly equipped.

White 3-ton and 5-ton trucks are for heavy hauling. These trucks are reducing hauling costs and increasing profits for scores of Lumbermen. By using White Trucks many concerns in cities have been able to do away with branch depots which unduly increase overhead expense. Concerns who do business in the country surrounding their location find it cheaper and more satisfactory to make these deliveries by motor truck instead of by rail.

The White 5-ton Logging truck has lately been produced to meet a long felt need for a practical, economical motor truck for use in logging work. On a small scale this truck does the combined work of the logging locomotive, the skidder and the donkey engine.

If you are convinced of the advantages of using motor trucks, you may be just as certain that White Trucks are durable and efficient to the extent that they can be used with *profit* in your business. 47 concerns in the Lumber Business are using 80 White Trucks with complete satisfaction.

White $\frac{3}{4}$ -Ton Truck owned by the Morrison-Skinner Co., Wakefield, Mass.

White $1\frac{1}{2}$ -Ton Truck, owned by Downes Lumber Co., Boston, Mass.

Two White 3-Ton Trucks owned by The J. H. Gerlach Co., Cambridge, Mass.

Our
MACKINAW PANTS

The materials in these pants are the best that money can buy. The workmanship is on a par with our other goods.

Our **BULLHIDE MOCCASINS**

Are steadily gaining in favor owing to their warmth and wear resisting qualities.

Our
PURE WOOL SOX

Extra strong double heel and toe. Wear longest where the strain is greatest. They will stand the test.

Our
PLYMOUTH GLOVES

The best made for all kinds of hard wear. Peccary hog leather is a favorite with lumbermen. The toughest and best wearing glove it is possible to make.

This Brand is on all our
Goods and stands for

Established 1852

QUALITY

First, Last and all the
Time.

Our
PULLOVER MITT

Made in burro, sheepskin, horsehide and peccary hog leathers. Specially adapted for lumbermen, rivermen and miners.

Bain Sleighs for Logging Operations

Famous for their great Capacity and Light Draft

Logging is a severe test of a sleigh.

The best is none too good, even though you may pay considerably more than for one which possibly may appear to be just as good.

It is only by actual test—the test of time and hard usage—that the difference is apparent, and the increased first cost is forgotten. The quality is remembered long after the price is forgotten.

The cross chain couplings allow great flexibility and the hind bob follows in the tracks of the front when turning. Some prefer the short reach for well broken roads, as a sleigh so fitted can be backed same as a wagon.

Swing bunks are an advantage in the bush, as they can be swung parallel with the runners when driving without a load.

Any of these sleighs except the heavy sloop can be fitted with 38, 40 or 42 inch bolsters for general work.

Our new catalogue No. 30 tells all about it and is yours for the asking.

The Bain One-Beam North Shore Sleigh

Steel Shoes; Swing Bunks or Bolsters; Cross Chain Coupling; 2 ft. 10 in. or 3 ft. Track. Clearance under Beam 9½ inches.

The Bain North Shore Sloop Sleigh

Steel Shoes; Cross Chain Coupling; 2 ft. 10 in. or 3 ft. Track. Clearance under Beam 7 inches.

The Bain Heavy Sloop Sleigh

Steel Shoes; Short Reach or Cross Chain Coupling; Furnished without Bolsters but with king bolts front and rear; 3 ft. 4 in., 4 ft. 4 in. or 4 ft. 8 in. Track. Clearance under Beam 7 inches.

The Bain Double Beam Manitoba Sleigh

Steel Shoes; Short Reach Coupling; 3 ft. track. Clearance under Beam 9½ inches.

GREAT STRENGTH & DURABILITY

Dick's Balata Belting, the best known fabric belt in the world, is specially distinguished for great strength and durability. Most gratifying results have been obtained from Dick's Belts as regards retention of strength. There are cases on record where Dick's Belts have been running for over twelve years and not only have retained their strength, but show not the slightest signs of wear and tear.

Write for Catalog on "Transmission Appliances."

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale :

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 16-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

Special Belts for Special Purposes

Goodyear Imperial High-speed Belting

For high speed a High-speed Belt should be used. Great strength is demanded. A belt that is to grip a small pulley and transmit high power must be specially built for the purpose. It must resist the strong tendency to slip on the small, rapidly-revolving pulleys.

This Goodyear High-speed Belt is made with a friction surface that grips the face of the pulley—conveying *all* the power.

It gives long service. The Belt is durable because there is no internal friction—no ruinous grinding. That is where the Imperial High-speed Belt excels. It flies around a small, high-speed pulley without setting up internal friction.

In Goodyear Belts the elimination of all stretch, and the solid cohesion of duck and rubber, prevent any movement within the belt. Thus the Belt gives long and efficient service.

Elevator Belts

Elevator Belts are a Goodyear specialty. The essential requirement in these belts is strength—and Goodyear Elevator Belts have it. That is why they are in constantly-increasing demand. The buckets do not pull out. Long wear in the belt is assured because the plies of fabric do not separate in service. Goodyear Rubber Belts are used in hundreds of elevators throughout Canada.

Conveyor Belts

Where a sound and reliable belt is needed for hard service—for the conveying of stone, grain, ore, coal, etc., a Goodyear Conveyor Belt specially made for the work is the best investment. The Goodyear Conveyor Belt has a rubber face of great toughness, which prevents cutting and chipping, and increases the life of the belt. Not affected by weather. We make Conveyor Belts to any specifications. No better conveyor service can be given than that obtained from a Goodyear Belt.

Endless Belts

We make Endless Belts to order in any width, length and thickness—and for any purpose.

Send for our interesting book on the choosing of a Belt—you'll find it useful. It is free.

Goodyear Conveyor Belt for the Rainy River Gravel Co., Vancouver. Made in one piece—seven hundred and fifty feet long.

Bathurst Lumber Company, Limited
 Bathurst, New Brunswick

Are your horses of use to you?

This seems an absurd question—and the answer is always
"Of course they are"—In which case provide your stables with:

Johnson's Reliable Veterinary Remedies

Johnson's Horse Liniment, No. 1 (Alcoholic)

1 gal. jugs (Imperial)	\$4.50 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	15.00 doz.

Johnson's Horse Liniment, No. 2 (an oil liniment)

1 gal. jugs (Imperial)	3.00 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	11.00 doz.

Johnson's Horse Colic Remedy

A sure and speedy cure for all kinds of Colic	
1 gal. jugs (Imperial) 40 doses	5.00 gal.
1 lb. bottles 4 doses	8.00 doz.
2 lb. bottles 8 doses	15.00 doz.

Johnson's Veterinary Healing Ointment (Gall Cure)

2 lb. tins	2.00 per tin
4 oz. tins	3.50 doz.

Johnson's Condition Powders (Concentrated)

1 lb. Packages	3.60 per doz.
----------------	---------------

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, Collingwood, Ont.

Are Your Horses in Good Condition?

Horses for all lumber work are subjected to the hardest hauling under the most severe conditions. They should therefore be as fit as all possible care and attention can make them.

**In the Lumber Camp,
Around the Mill, In the Yard**

and wherever lumber has to be hauled the horses are always liable to a multitude of small injuries which if not attended to promptly may develop into lameness or disfigurement, thus reducing the working capacity of the horse and impairing its value from a sale standpoint.

You should always have handy and ready for use

Good Liniment

to reduce bruises, strains, soreness; allay pain and inflammation quickly, be an antiseptic dressing to a cut or burn, or to heal a wire cut, wound or laceration.

ABSORBINE

is an antiseptic healing preparation as well as a resolvent and a discutient. It will assist nature in bringing about a dissolution of the bunch, restore the circulation, gradually restoring the part to its normal condition.

It will produce permanent and complete results without blistering or removing the hair, and will leave no blemish. You can work the horse at the same time.

All enquiries on special cases answered without delay—full information and instruction on request. Absorbine \$2.00 per bottle at dealers or express prepaid. Manufactured only by

- SPARTAN - The Unconquerable

Fill out this Coupon and mail today—Booklet will be sent free.

The Saw Mill—the Planing Mill—in fact every woodworking plant constantly demands a maximum of power.

It is in these plants that the highest degree of power efficiency was not attainable until **Spartan** "The Unconquerable" was introduced.

The modern machines and those Spartan equipped guarantee you a plant continually operating at maximum efficiency.

Spartan Belting embodies great pliability, wonderful tensile strength and extraordinary durability.

To this unique combination Spartan Belting owes its present universal popularity—a combination which renders **Spartan** especially adapted to the exacting demands of planers, matchers and other woodworking machinery.

Send for further particulars and for Spartan Book.

Simonds

Crescent ground cross-cut Saws

What does the Woodsman look for in a Cross-Cut Saw?

Easy cutting.

Fast cutting.

Less filing.

Longer life.

And these things mean a bigger and a better day's work done by him and more money earned. Yes, more money each and every day that he uses a Simonds Crescent-Ground Cross-Cut Saw. The Woodsman never worries about a little extra price. It's results he wants for he knows that the right saw will make up its price and a lot more in short order. Simonds Crescent Ground Cross-Cut Saws can be purchased from leading Jobbers and Dealers, or write to us. Factory in Montreal.

SIMONDS CANADA SAW CO., LTD., Vancouver, Montreal, St. John

The Cost of Lumber Production

can be reduced to the minimum if care is exercised in the selection of the machinery. For years

KNIGHT'S SAW MILL MACHINERY

has been known to lumbermen as the Quality Line that makes for efficiency in lumber production—better lumber at less cost.

The style "S" mill shown herewith is built as a single mill only, and is especially recommended for cutting out small tracts of timber. Its size permits of easy transportation from tract to tract.

Full details of this mill and our entire line is given in our catalog. Write for a copy.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 17

Pulp and Paper Situation Clearing

In connection with the duty on Canadian pulp and paper entering the United States from provinces which prohibit the export of pulpwood, the general situation seems to have been cleared, to some extent during the last month or two. The proposed pulp and paper clauses of the new United States tariff upon which the United States Government is now at work, gave rise to a general fear that they would impose a duty of \$2 per ton upon chemical pulp coming from such provinces of Canada as prohibited the export of pulpwood. Canadians were at a loss to understand the reason for this move. Even now, with the assurance of the United States government, as recently received from Washington in a definite and official communication, Canadians are at a loss to understand the reason for the clause upon which they based their original fears. Unless this clause is to be amended or struck out, they will still wonder what in the world it is for.

However, there is little use in setting up a straw man for the pleasure of knocking him down. To-day, Canadians have a definite assurance that there will be no discrimination whatever against their pulp, as was feared at first. The matter has been referred to the United States officials whose duty it would be to interpret the clause if it should be enacted and they are responsible for the reassuring announcement which has been made. Under these circumstances it is interesting to look back a little into the history of this affair and recall the objects that were held in view in the first place, noting to what extent they have been attained. The beginning of the situation was really the result of Ontario and Quebec deciding that it was their duty to prevent their saw logs and pulpwood logs from going out of the country in an unmanufactured state, to provide raw material for the industries of the Northern States. The decision was a sensible and perfectly proper one, but unfortunately it involved a seri-

ous loss to the industries of the United States which depended upon these logs for their raw material. Canadians would willingly have avoided causing such an injury to their neighbors, if this could have been done without involving a still greater injury to themselves. This was impossible and the prohibition was imposed. Since the Ontario government prohibited the export of saw logs a great lumber manufacturing industry has been built up in northern Ontario. Quebec has done much the same thing in connection with its pulp and paper industry, although there are two very clearly opposed views held by prominent manufacturers and exporters of that province, as to the effect of the prohibition of the export of pulpwood.

Many side issues have been brought into play at different times during the progress of these events. We have heard much of retaliatory measures on the part of the United States, and of retaliation by the people of Canada. Fortunately, the governments of both countries have taken careful courses and have acted only after much study of the matter. The situation to-day briefly, is that the prohibition of export on the part of several Canadian provinces stands solidly, and the government of the United States is assuring us that Canadian pulp will not be subjected to any discrimination because of this prohibition. A reasonable solution of the matter will probably be worked out by the law of supply and demand, if the governments of both countries will continue to look at the matter from a plain business point of view, ignoring the efforts of those who wish to take offence, where no offence is given.

Trade Activity Returning

Business conditions in Canada give every indication of recovering steadily from the stress of tight money and the nervous fear which struck the industrial world a month or two ago, when the real estate craze was strangled by the banking interests. Those who diagnosed conditions properly were confident some time ago that improvement would come this fall at the latest. The fact that the improvement is already at hand indicates forcibly the healthy general condition of the business of the country. It is unquestionable that the situation in Canada to-day is such that only a most unforeseen combination of circumstances can cause financial depression for many months to come. The basis of the present prosperity of the country is the large amount of immigration which continues to pour into Eastern Canada and spread itself throughout every province. So extensive has the immigration become that the field of settlement has been enlarged, until to-day it covers the whole country. A few years ago, immigrants for Canada seldom had any other destination than the prairie or the west coast. Those who came into Canada then, reported back to the Old Country about the opportunities which apparently awaited others in the great stretches of wonderful country in Eastern Canada, which they had passed through on their way to the west.

To-day the tide of immigration commences to settle once it reaches the shores of Canada. Industry all over the country is coming to feel the benefit of the influx of labor and at the same time these people who are enabling us to keep up with the demand for manufactured products, are themselves creating an additional demand, so that the whole producing business of the country is working round an ever-widening circle. With the benefit of conservative business methods, such as have been encouraged by the recent temporary halt in business activity, there is no reason why these prosperous conditions should not continue to increase at a steady and encouraging rate for a long time to come. Canada has youth, vigor and unbounded ambition on her side—a combination of forces which, taken in conjunction with its lavish heritage of natural resources, must involve great productive developments throughout a long period of years still to come. To-day, with the general improvement in the financial markets of the world, Canada's prospect for prosperity during the rest of the present year and most of next are unquestionably bright.

A strong endorsement of these views was offered in the last issue of the Canada Lumberman by the opinion expressed by Mr. J. G. Robson, president and managing director of the Timberland Lumber Company, Limited, New Westminster, B.C. Mr. Robson is a young Canadian with great confidence in the future of the country, a man

who is making a success of the lumber manufacturing business and one who has his eyes wide open, to scan the horizon of the business future. Recent business developments lead Mr. Robson to expect that in Eastern Canada, there would be, in the near future an excellent opportunity for opening up business with lumber dealers. The situation seemed most logical from his point of view and he made a trip to Ontario for the purpose of confirming his views. It is not long ago since British Columbia manufacturers were all of the opinion that there was very little trade for them, to be had in Ontario. The high freight rates and the keen competition of southern pine seemed to make it impossible to deliver British Columbia timbers in Ontario at a profit. Recent years have shown the error of this belief. Conditions have been altering during the last few years and a number of British Columbia firms are now successfully competing in the markets of Ontario for large contracts for timbers. The trade has indeed obtained an excellent footing, in spite of the long freight haul. Under these conditions, it is certain that when the Panama Canal has opened, the products of British Columbia forests, with comparatively cheap transportation charges, will enter very extensively into the trade, not only of Ontario, but of all Eastern Canada. These are Mr. Robson's

firm convictions and he has gone back to the west full of an enthusiastic determination to prepare himself for the trade which he sees opening out in the future. During his visit, Mr. Robson succeeded in making a number of valuable connections in Ontario and sold enough of the product of his mill to warrant him in going ahead, even if there were no Panama Canal opening to be considered in the future. The most interesting feature of Mr. Robson's experience is the fact that he not only picked up a quantity of good business with retailers, but came very strongly to the conclusion that there was a large business to be done in British Columbia timbers in Ontario, if manufacturers would watch for the big contracts and compete vigorously on the tenders.

A few years ago, manufacturers of eastern spruce in New Brunswick thought that the freight rate to Ontario was too heavy for them to compete successfully in the Ontario markets. The experience of the past year has shown that this was a mistake. Eastern spruce has been going more and more into Ontario of late and presents a case to some extent similar to that of the British Columbia manufacturers, who can with equal reason expect to work up a very profitable trade in Ontario and Eastern Canada from now on.

Is Your Machinery Properly Adjusted?

At this time of year, sawmill operators in Canada know pretty nearly everything about the eccentricities of their machinery, saws, etc., and it may seem a little presumptuous on the part of anyone to give them a talk upon such matters; but no one ever knows so much that he cannot learn a little bit more, and the man who has charge of machinery should always be in a receptive frame of mind when anyone comes around talking about practical problems. For this reason we are glad, in this issue, to place in front of saw mill managers, filers, sawyers, etc., a few condensed facts about the problems which they are so continually having to solve. An article appearing elsewhere in this issue deals with a set of problems which the manager of a small sawmill has to face many times a year. The owner or manager of a small mill has the greatest proportionate amount of difficulty in connection with his work. The owner of a large mill has the latest variety of machinery in his plant and employs specialists to see to its proper adjustments and running. He has at his service, the experience and resources of the makers of the machines, who are experts in connection with every conceivable problem that may arise during the operation of the machines. The owner or operator of a small mill is not so fortunate. His resources do not equal those of the large mill owner. He has to meet many a new problem face to face in the woods, and find the answer without delay, or lose a lot of money.

There is only one way to produce a good manager or operator of a small mill. Long experience is the one sure guide and it should be coupled with the experience of others whenever it can be secured. This is where the trade journal comes into the field. The information which it gathers from men of experience is of the greatest benefit to all who read its pages. The article referred to above is written by a man who has had a long and varied experience in connection with filing and operating in mills of many classes and in a great many different parts of the world. His experience in fact, is probably greater than that of any other man who has been engaged in this work.

Moreover he is one of those men who knows how to tell others in simple language what he has found out himself. We recommend our readers to study his article closely. It will re-pay them amply, we feel sure. When they have read it perhaps they will differ from the author in some regards, if so, the Canada Lumberman will welcome a letter or an article from them, giving their opinions upon the subject.

Writing an article or a letter of this nature brings its own reward. It helps others and it helps the writer probably more than anyone else. A man who has written down his thoughts in black and white and has seen his article in print, will always remember the views which he has expressed and will think them over more critically than he would if he had only spoken about the subject. The fact that a man has taken enough interest to tell others his views, is a certain indication that he knows a good deal about the subject, and that he is well on the way towards knowing a great deal more. It is not with a selfish end in view, therefore, that we ask readers of the Canada Lumberman to study its pages closely and then send us their views. Our own interest of course is involved, as we like to have other people fill our pages for us and save us the trouble, but we like much more to be the means of handing on to others, information which has been secured as a result of experience and which will give practical help to our readers.

The moral of the article referred to, is that in the running of a small rotary saw mill, it is just as important to have the power, the saw, the carriage and everything else properly adjusted for the work which is in hand as it is for a large mill. One is apt to think that because it is only a small mill it is not worth while taking as much care of as a larger one. This is a mistaken view and it leads to the poorhouse. The advice given by Mr. Liebe in his article upon "The Round Saw" should be taken to heart by all who operate these mills. Then there would be much less badly manufactured lumber; the profits of mill owners would be greater, and the task of the lumber salesmen would be far more pleasant.

The Advertising of Lumber and Shingles

In these days of rapidly changing conditions the purveyors of almost every product in common use appear to be aware of the fact that the people as a whole have become voracious readers and also confirmed bargain-hunters. Whether the first mentioned truth is a result of the growth in refinement and the spread of education or the product of the almost universal struggle to make ends meet, is a problem we willingly leave to others to solve while we attempt to extract a moral from the facts themselves. In this manner the Western Lumberman, recently discusses a situation which is daily becoming of greater importance to the manufacturer of lumber,

The spread of the reading habit and the initiation of modern merchandising methods have effected a revolution in old-time store-keeping and trading. Great departmental houses have been created in the United States and Canada, and as a result of the liberal advertising done in daily and weekly journals, trade papers, magazines and catalogues, some of these firms find purchasers in every state in the Union and every province in the Dominion, actually numbering their customers by the million.

Most of us have heard how Wanamaker, the great merchant prince, handled the advertising medium many years ago—he invested

the entire proceeds from the sale of his first barrowful of dry goods in newspaper space announcing the bargains he would offer the day following. Continuous publicity made him an hundred times a millionaire. To bring the lesson nearer home, it is a fact well known in the advertising world that a certain Chicago mail order house, whose volume of business shows a tremendous growth each year, makes it a rule to spend annually in publicity six and one-quarter per cent. of its gross sales, which in 1910 reached the enormous total of \$65,000,000. Out of every dollar received the firm thinks it good business to spend 6¼ cents to get another dollar's business. The ordinary merchant, if he be an advertiser at all, probably devotes one per cent. or less of his gross receipts to the work of keeping the buying public informed as to the quality of his goods and the range of prices awaiting customers. Is it any wonder, then, that mail order houses are driving the small storekeeper out of business, and making serious inroads in the territory hitherto monopolized by leading firms?

Until a few years ago the manufacturers of lumber and shingles in the United States and Canada did not evince any interest in the rapidly changing trade conditions. Certain enterprising lumbermen in state or province carried spaces in their trade journals, but the rank and file did not expend one cent for publicity. Particularly was this true of the shingle manufacturers, who seemed to think that they possessed a heaven-sent immunity from successful competition. Thus we have the case of a vast industry deriving many millions from the

sale of products, yet lacking any definite program looking to the popularizing of their goods with present or prospective customers.

This devil-may-care attitude—this penny-wise-pound-foolish policy—has led up to a state of things that will take long to set right again. While the lumber and shingle men have been taking their profits, or bucking unfavorable market conditions, the manufacturers of cement, patent roofings and other substitutes for lumber and shingles have been expending millions of dollars in advertising campaigns designed to impress the public with the merits of their goods. That they have met with a large measure of success is undoubted—the tremendous increase in the sales of cement and patent roofings can no longer be ignored. Several Washington and Oregon associations of lumber and shingle manufacturers—alive to the peril threatening the industry—are planning to raise a sum in excess of one hundred thousand dollars to help counteract the damage already done, and if possible re-establish their products in the public favor.

While the sale of substitutes other than cement and steel in British Columbia and the prairie provinces has not yet assumed serious proportions, the aggressiveness displayed in the invasion of other territory should be taken as a warning. Our shingle men stand to lose much should the demand for their product on the prairies suffer a curtailment. There is a great deal that is convincing to be said in favor of shingles as a roofing material—the makers should see to it that the information reaches both the retailer and consumer.

Is The Retailer Ready For Trade?

How many retail lumbermen have given the proper amount of attention to the market situation this summer? The answer would be hard to give, but many wholesalers would state that the percentage of those who have neglected to do so is much larger than usual. The retailer this year has probably lost an opportunity such as he is not likely to have again for some time. How does the average retailer look at this matter? Does he follow the principle laid down by large financial and commercial firms, who study market conditions closely, over a long period of time and base the buying policy upon the conclusion thus reached? Some retailers do this. Many of them in fact follow this principle, but the percentage is not as great as it should be. There is no reason why a retailer should not spend many an hour poring over the newspaper and trade journal accounts of trade conditions, weighing the evidence on the scales of experience which he has constructed out of his own business dealings, and reaching a very definite and valuable conclusion. With this conclusion he should combine all the facts available about the consumers in his own district. He should gather information as to the plans of those in his locality who intend to build. He should watch the conditions of all the prospective lumber consumers whom he can reach and should be prepared in large measure beforehand, to meet their requirements at an attractive figure. It is only by keeping posted upon prospects and upon market conditions that the retailer can come out ahead of the game.

Looking at the events of the present summer, it is difficult to conclude that many retailers have followed this principle. Had they done so, the volume of buying orders would have been greater. It looks as though most of them have placed too much importance upon

reports of hard times and have concluded that they would be able to buy lumber cheaper a little later on, forgetting the teachings of experience to the effect that they have done exactly the same thing in past years and have found out their mistake subsequently; also forgetting that in the very near future there is certain to be a shortage of cars and a higher level of prices. These things are just about as certain to come to pass as the tides are to ebb and flow.

This year it already looks as though there will be a strong demand in the fall and a corresponding shortage of cars for handling both the increased movement of lumber and the enormously greater movement of grain which is now assured. It is difficult to understand why so many retailers refuse to recognize these facts at a time of year when lumber is cheap and cars are plentiful. But human nature seems to repeat itself all the time, and year after year there is about the same percentage of retailers clamouring for stocks at a time when cars are scarce, who should have laid in their supplies a few weeks earlier.

This is not written with a view to boosting the demand for lumber. We believe that a good demand is developing today and that it is certain to make itself felt in the near future. The object of this article is to stir up some retailers to get ahead of the fall demand. There is time even yet to decide upon requirements for the fall, before the rush comes. It can be done with reasonable safety today and it must be done by anyone who wishes to have stocks on hand and to be able to devote his time to selling and delivering lumber without having to worry about his ability to secure stocks on account of the car shortage.

Editorial Short Lengths For Busy Readers

On account of the light demand and low prices the British Columbia Shingle Manufacturers' Association, announced on August 1st, that the mills would close and not reopen until some time in September. Forty of the largest mills in the province are represented in the association.

The National Hardwood Lumber Association, have issued in pamphlet form a report of the official proceedings of the 16th annual convention of the association. A generous supply of these pamphlets has been prepared and the secretary Mr. F. F. Fish, advises that he will be glad to send copies of the report to anyone interested.

Hon. W. H. Hearst, Minister of Lands and Mines for Ontario, states that the forest fires of this season have not been so destructive as in former years. In the recent fires there has been little damage in the north, and the places where fires have occurred have been principally confined to districts burned over within a year or two.

Before the Dominion Board of Railway Commissioners, sitting in Montreal, the Fletcher Pulp and Lumber Company, Sherbrooke, P.Q., applied for a reduction in the rate on export lumber from Sherbrooke to Montreal by the Grand Trunk Railway. The application was postponed, the chairman promising to gather information as to the amount of lumber hauled.

B.C. Lumberman's Rapid Success

J. G. Robson, New Westminster, B. C.

J. G. Robson

Mr. J. G. Robson, president and managing director of the Timberland Lumber Company, Ltd., New Westminster, B. C., although a young man, has advanced far on the road toward business success. Mr. Robson was born at Ayr, Ont., on April 20th, 1887, and was educated in the public school at that place. When he had reached an age to go into business he obtained employment with the Ogilvie Flour Mills Company and spent three years for them buying wheat at various points in Manitoba. After this he got into the lumber business in the Crow's Nest Pass country, and in 1908 started a shingle manufacturing business at New Westminster.

All this was preliminary to a successful career as a manufacturing lumberman which opened to Mr. Robson in the year 1910, when he took over the plant and limits of the Timberland Lumber Company, Limited, then a joint stock company. From that time until the present, the company has been making rapid strides and has been exceptionally successful. The mill of the company is located about six miles from New Westminster on the line of the British Columbia Electric Railway. The head office is at New Westminster. The mill manufactures about 50,000 feet per day, 65 per cent. of which is fir and the balance spruce and cedar. It is built and equipped specially for handling bill orders.

Mr. Robson has made it his general policy to see that every log as it comes to the mill fits in with an order for stock already on hand. Thus the logs are rushed directly from the woods to the cars as quickly as possible. Delays are avoided and the cost of manufacture is greatly reduced. In order to carry out this policy Mr. Robson has made himself personally familiar with every detail in connection with the whole manufacturing process from the selection of the trees in the woods to their sale in the market. Practically nothing occurs in connection with the operation of the plant, or the woods operations, with which he is not intimately acquainted. Any lumber manufacturer will readily appreciate the great advantage which Mr. Robson thus has in turning out high grade lumber and timber and disposing of it at a profit.

In addition to his interests in the Timberland Lumber Company, Mr. Robson owns about one-third interest in the Westminster Woodworking Company, Limited, at New Westminster. This company operates a sash, door and woodworking plant. Mr. Robson is also chairman of the lumber committee of the New Westminster Board of Trade and a prominent figure in Hoo Hoo, in which he occupies the important position of Vicegerent Snark for Western B. C.

The limits of the Timberland Lumber Company, Limited, are located close to the mill, a fact which also assists greatly in the economical and rapid production of high class lumber and timber. A logging railway about three miles long is now being built into the limits from the mill. The equipment for this line has already been purchased, or ordered, and includes a Climax locomotive.

Mr. Robson is one of those typical western lumbermen who are equipped with a natural business instinct and a cheerful optimism which enables them to weather periods of commercial disturbance and to take every possible advantage of more favorable conditions whenever they develop. He is today a firm believer in the immediate future of the lumber trade in British Columbia and looks forward to an active and profitable fall trade followed by record business in 1914.

The work of improving the plant of the Riordon Pulp and Paper Company, Hawkesbury, Ont., is proceeding at a very satisfactory rate. The third of the new digesters has been completed and has been tested prior to lining; the fourth digester is more than a third completed. One of the new digesters will start on November 1st and another on 1st December. The company have an enormous stock of pulp wood at the mill, the pile containing about 50,000 cords or more.

American Staves for Scotland

The United States Daily Consular and Trade Reports in a recent issue say: "Until quite recently there was no possibility of American manufacturers competing for the herring-barrel trade in Aberdeen, Scotland, the local price being about 70 cents per barrel, but owing to the gradual advance in price of Swedish spruce and Scotch fir, of which these barrels are made, it may soon be possible for the American trade to compete. Only two sizes of herring barrels are made, called, respectively, the barrel and the half barrel. The former is 31 inches long by 18 inches in diameter at the ends and 22 inches in the middle. The half barrel is 24 inches long, 14 inches diameter at the ends, and 18 inches in the middle. The staves are about 4 inches wide and three-fourths inch thick. The barrels sold in mid-June at 84 cents and the half barrels at 70 cents each set up, if bought by the thousand. The barrel materials are imported almost entirely from Sweden, the staves, invariably of Swedish spruce and of the dimensions already stated, come ready-made. The Scotch fir for making the ends also comes largely from Sweden as the local supply seems to be growing scarcer every year.

Staves are about \$53 per St. Petersburg standard, each standard yielding staves for 195 barrels or 300 half barrels. The ends are imported usually in 9-foot lengths, 3½ to 9 inches broad, and three-fourths inch thick, the price being \$20.50 per thousand superficial feet, each thousand feet yielding 240 pairs of ends. For half barrel ends, the usual lengths are 6 feet 3 inches, 3 to 8 inches wide, and eleven-sixteenths inch thick, the price being \$19.50 per thousand superficial feet; each thousand feet of lumber yields 320 pairs of ends. Many of the larger cooperage firms in this district are able to use as much as 1,600 St. Petersburg standard of Swedish spruce for staves and 1,000,000 superficial feet of Scotch fir for ends in the course of a year. There is no duty on cooperage coming into this country except the harbor dues, amounting to about 60 cents per ton, with a charge of 25 cents per ton on ship's register."

No Discrimination Against Canadian Pulp

An official and definite assurance that there will be no discrimination against Canadian pulp in the provisions of the new United States tariff has been received by the Canadian Government from Washington. Although it has been the general belief among Canadian pulp manufacturers that they were to be discriminated against, this view has not been entertained by the Government and it now appears that its view is the correct one. The supposed discrimination was looked for as a result of a clause in the proposed United States tariff governing wood pulp imports, which provides that pulp manufactured in any province in which there was any increased license fee, or any restriction against the export of either pulp, pulp wood or pulp paper, or chemical pulp, coming from such province, should be subject to a duty of \$2 per ton, all other pulp or pulp wood being allowed to enter the United States duty free. The belief in Canada was that this provision would operate against pulp manufactured from wood cut on Crown lands in Ontario, Quebec and New Brunswick. The Government accordingly communicated with the British Embassy at Washington and representations were made to the United States Government. The matter was finally referred to the United States officials whose duty it would be to interpret the enactment, and their statement is that no discrimination would result. This effectually sets at rest the whole recent agitation over the matter.

Sir Lomer Gouin, Premier of Quebec Province, stated to certain paper interests recently that no matter what was done in regard to the tariff by the new Administration at Washington, the embargo on Crown Lands pulp wood in Canada would not be raised. This sets definitely at rest the uncertainties over Crown Lands wood in case a discriminatory tariff were to be imposed by the United States. It is now generally believed that paper and pulp will be admitted free to the United States, while as regards chemical pulp, manufacturers can see no reason for putting on a discriminatory tax, since there has been no demand for this from sulphite manufacturers in the States, and since, in any case, a discriminatory tax on sulphite made from Crown Lands wood would fail in its object of getting the embargo on such wood raised.

A copy of "No-Rim-Cut News," the official organ of the Goodyear Tire & Rubber Company of Canada, has reached us. The paper is made exceedingly attractive by a number of cuts and upon the front page is to be found a view of what is to be the new home of the company in Toronto. It contains considerable information concerning the Goodyear company and their methods of operation. An article on their monthly credit memos is interesting, while the description of their laboratory tests of all raw materials and the second instalment of the method of making an automobile tire are full of information. "No-Rim-Cut News" should prove interesting reading to the many users of rubber tires.

Lumbering Operations on the St. John

Development of the Industry from the Early Days to the Present—
The Shear Boom and its Results

By I. Fraser Gregory*

The St. John River was first visited by white men on 24th June, 1604. Champlain and DeMonts were the explorers. As it was St. John's Day the river was named after this Saint. The landing of the Loyalists at the mouth of the river and the birth of the City of St. John on the 18th of May, 1783, one hundred and twenty-nine years ago, was the beginning of the "Story of Lumbering on the St. John River."

The St. John River drains the largest territory of any river flowing into the Atlantic Ocean between the St. Lawrence and Susquehanna rivers, with a total length of 450 miles and a drainage area of about 26,000 square miles.

The early lumbering on the river was confined to the territory below Grand Falls on account of the Falls, and on account of the destruction there would be to lumber coming over them. It was not until the year 1850, when pine was getting scarce, that anyone ventured to cut above the Falls, logs and timber to come to St. John.

The headwaters of our river overlap the Chaudiere in Quebec, the Penobscot in Maine, and the Restigouche and Miramichi in our own province. The territory drained nearly equals the area of our whole province. Like a great tree it is spread out, each of its branches contributing to the volume of water passing into our harbor under the Suspension Bridge.

Although we now have railways from the mouth of the river to the St. Francis River and at the source in Quebec where there are settlements, when you leave these settlements you have 90 to 100 miles of water in the forest without people or roads, excepting the tote roads of the lumbermen. All is as God made it.

The St. John is an international and interprovincial river and the lumberman must understand the Crown Land regulations in New Brunswick and Quebec, also the conditions in the State of Maine, where there are no State lands. The Legislature of that State having

decided in its wisdom fifty years ago that the wild lands were not worth the cost of caring for, sold them for a song to private individuals. The result has been a great loss of revenue to the State and the making of enormous wealth in some families.

The method of operating the Crown Lands of Quebec and New Brunswick are very different, but it would take too much time to compare them. My own opinion is Quebec has a much better system than New Brunswick.

With the building of the Intercolonial Railway and later what is now the Canadian Pacific Railway from St. John to Fredericton and on up to Edmundston, and still later the Temiscouta and Bangor and Aroostook, lumbering conditions changed. The increasing population up river has had its effect, also the establishing of branch banks or trust companies in every town or village. The changes are still going on and will continue until the last sawmill disappears from the City of St. John, but that will not be to-morrow, for St. John is yet the best place in which to manufacture, even if it costs more to get the logs here. Here we have transportation facilities to all parts of the world by water, which is cheaper at all times than rail carriage, a good market for our by-products, good machine shops, well trained men, and a milling season 50 per cent. longer than there is up river.

The lumbermen of the past were indeed the pioneers on the St. John River, and they were men that we cannot but admire when we look back at their achievements in spite of the tremendous odds against them. Their portage roads have become our highways, their depot camps and mill sites our towns and villages.

The export of lumber from St. John to Great Britain did not commence in earnest until the date of the Crimean War, 1854, when the Baltic ports were closed to Great Britain and she had to look elsewhere for her timber, and masts and spars for her navy. So let us take an operation a little later and go to Grand River. There were no railways in the Province, all supplies had to be taken up river by

water from St. John in the summer and by teams in winter. The start would be made from Fredericton in late September or early October, just as the autumn freshets began, in one or more towboats—long flat bottomed boats with a cabin at the stern, on top of which the steersman with the end of his long sweep in his hand guided the boat and kept a sharp lookout for rocks ahead. The horses travelled the shore towing the boat on a long line made fast to the foot of the single mast set well forward. A guy line ran from the middle of the tow line through a block at the masthead to bitts at the foot of the mast. By pulling on this line it was possible to raise the tow line to clear rocks or bushes along the shore. By proper manipulation of the sweep the boat ran in the water parallel with the shore and could be steered to right or left of the rocks.

The cargo of the boat consisted of pork, codfish, corned beef, flour, beans, dried apples, molasses and tea as provisions for the men; very seldom any potatoes, no sugar or butter and no fresh meat. For the horses, hay and oats. Hay was worth \$12.00 per ton; oats, 50c. per bushel; pork, \$32.00 a barrel; flour, \$11.00 per barrel, and molasses 50c. per gallon.

There was invariably a big chest called the "Wangan," which contained first of all tobacco, then warm jumpers, underclothing, mitts, socks, moccasins, writing paper, cards, jews' harps, patent medicines, etc., etc., in fact a little of everything that the boss thought might be useful during the long winter. These were sold to the men as wanted and charged up to them. It is a common report that the prices charged were fabulous, and woe to the man who was careless about his "Wangan" bill during the winter; perhaps when spring came nothing was coming to him. To come out of the woods with money, he needed to be well clothed when he went in. From the "Wangan" socks cost 60c. a pair, tobacco \$1 per pound.

The Rate of Wages

The men were hired in Fredericton, sometimes by the month, but just as often for the route, which meant for a lump sum they agreed to work the winter in the woods, and also continue until the drive got down to the booms below Fredericton the next spring. If they deserted before the end of their contract they lost any pay coming to them. The best men (choppers) got from \$12 to \$16 a month. Re-

gent street was the headquarters for the men flocking in from the country to hire for the woods. There was plenty of rum going. Each man hired demanded an advance on account of wages to rig himself out and leave with his family, but often the whole advance was squandered before the start, and it was usually a pretty drunken party that boarded the boats.

Sometimes when the party was large some of the horses were driven on the highways with loaded wagons; they usually made better time than the tow-boats. The boats took nearly a week to get to Grand Falls, being towed from the dawn of day until night. With low water there was many a struggle to get over the bars. In the hard spots the tow line was shortened until the horses were in the bed of the river close to the bow of the boat, one or two teams, a rider being on the back of one horse of each team, the men in the water, each side of the boat, with poles and peavies, the boss, from his point of vantage on the top of the cabin, directing. To make horses and men all pull together for a mighty effort required engineering ability and lung power. Sometimes skids or rollers had to be put under the boat, and as a last resort it might have to be partly unloaded. A rider on a tow-boat team must be a man of skill and nerve; the horses are restive under the conditions, and a rider could easily be thrown or his leg crushed between the animals.

At Grand Falls the boats and their cargoes had to be hauled from the lower to the upper basin. There would probably be several parties there at one time and the sight was inspiring, the engineering ability displayed by the foreman and the rivalry of the different crews to make the portage in quickest time lending a snap to the whole proceedings.

Two days more travel brings us to the scene of our operations, say twenty-five miles up Green River and in the wilderness. Perhaps if the water in Green River was too low the tow-boats were left at its mouth and the teams hauled in the equipment and provisions over a road that would be called to-day impassible.

Life in the Camp

The ground had been cruised previously, and the site of the camp located, so all started to build it, and the hovel for the horses. Six days would probably complete the job.

Let me describe the camp. It would be about 30 feet wide and 40 feet long, built of logs, or rather, the ends were logs. To look at it, it was nearly all roof, the side walls under the eaves being only two logs high. To the peak of the roof it was ten or eleven feet. Log rafters were set on the side walls, poles crossed them lengthwise of the camp, and the roof was covered with cedar splits or singles four feet long, the whole was chinked with moss, one door in an end and probably no windows, the interior being lighted through the smoke hole in the roof, about four feet wide and seven feet long, logged up a little above the roof line to make some draft, if possible. When the snow got deep in the winter it was almost completely covered, only the ends and rough log chimney showing. There were no stoves; an open fire was kept going constantly on the stone hearth in the middle of the camp, the smoke finding its way out through the smoke hole in the roof as best it could, and in calm, still winter weather it did very well, but when storms raged they were apt to be blown down, when every nook and corner of the camp was filled with smoke, to the discomfort of the men inside. Across the fire high above it a pole passed, and from it hung great hooks, on which the cook swung the big pots. At one end of the hearth was the bean hole, of which many of you may have heard—a hole in the ground into which the coal from the hearth could be scraped, completely covering the pot containing the soaked and parboiled beans, with a generous piece of pork, then

Stetson Cutler & Company's Mill, St. John, N.B.

Murray & Gregory Mill, St. John, N.B.

covered with ashes and earth and left over night. When the pot was dug out next day, the baked beans, still piping hot, beat any of the canned varieties of to-day and even "Mother's Own Make."

On each side of the camp were the bunks, the beds being made of spruce bows. The men slept side by side, with their heads close under the eaves, and their feet extending towards the centre of the camp. At the foot of the bunks was the "Deacon Seat," a flatted log. Often it crossed the camp, making three sides of a square around the fire, the fourth side of the square being occupied by the cook. On this seat the men sat about the fire after their day's work, swapping stories and songs of the woods, home and church, the elder men giving sage advice to the boys. Remember, there was no Standard or Imperial Oil Companies at this time, and the men had only the light from the fire in the long winter evenings. It is true there were candles or tallow dips, but they were too precious to light a camp. The cook might have one or two lighted to assist him in his work, and the teamsters had to have them for their lanterns to take to the hovel to look after their horses—not colt-blast lanterns' as we have, but tin boxes about the shape of a half-gallon can, punched full of holes, usually in a design, with candle inside and a little light getting out through the openings which were punched from the inside, the outside being rough like a vegetable grater.

With the Cook

"The cook occupied the end of the camp farthest from the door. On a rough table against the wall he made his bread and sweet cake. It was made fresh every day, not yeast-raised bread, but short or saleratus bread, and to bake it it was put in pans in a reflector before the fire. This was a tin affair about two and a half feet long and fourteen inches wide on the ends, with sloping top. It was open on the side next the fire and bottom, but closed on the top, back and ends. Under it one or two pans of dough were put and set before the fire until baked.

Just inside the door was the grindstone, at which the choppers and swampers took turns sharpening their axes for the next day's work. At that time no table was set from which the men ate. When the cook, who is the supreme power in a lumber camp, gave the word, each man in turn stepped up to the fire with tin plate and cup in hand and got his portion from the steaming pots and carried it to the Deacon Seat, where he sat and ate it.

The camp that boasted a fiddler or even a jew's harp player was to be envied. Singers were also desirable, and did much to entertain in the evenings about the fire. But their songs, I can't describe them; nothing we have nowadays resembles them. They called it singing by air, and there was no air to it, but the telling of a story of many verses about a maiden fair or a warrior bold in a drone that went up and down the scale, as the singer saw fit; no two would sing the same song to the same air—it was the story that counted.

At 9 p.m. lights were out and all had retired, leaving, possibly, a single individual laboriously writing a letter home. As soon as the fire commenced to die down it would get very cold, and from time to time someone who was too cold to sleep would get up and replenish the fire. Between 4.30 and 5 a.m. the cook, having breakfast well under way, would call "All hands, turn out."

Breakfast was quickly disposed of, and the men started for their work, with a lunch box slung over the shoulder of a swamper in each crew. Before daylight the men were on their ground, probably having walked two or three miles. They boiled the kettle and lunched in the open, not returning to the camp until daylight was gone.

The Season's Cut

In those days a million and a half to two million was a big opera-

View on St. John River showing a Shear Boom.

tion. Very little yarding was done, but what there was, was done with two horses. All the trees were felled with the axe. No logs under eleven inches at the top end were cut, and the whole tree was taken out of the woods in one piece, the average being six pieces to the thousand. Four teams could get a million of logs in the winter; now it takes six pairs. A pair of horses and driver could be hired for \$1 per, or \$26 per month. Then they only lunched once in the day; now twice. The value of logs delivered in St. John was \$6 per thousand. No stumpage was paid to the government, but they paid \$4 per square mile for permit to cut the area.

There has been no change in the hauling sleds excepting that they are a little wider to-day.

There is no question as to the snowfall being less now than it was in the olden times. Then it averaged about five feet in the winter, and when the snow was deep the choppers cut down trees standing on their snowshoes.

Then there were no holidays for the men excepting Christmas, and it was celebrated among themselves in the camp.

As spring approached and the long, bright days of March came, preparations were made for the drives. Men whipsawed boards for flangers and bateaux, pike poles and peavies were made and ironed. The majority of the men stayed on for the drive, which started about the 1st of May, fully two weeks later than now.

Life on the Drive

The great success of the drive is to get a good start, so the successful operator was good and ready when the roads commenced to break up, and the men enjoyed a few days' rest waiting for water in the streams. As soon as there was enough running to float a log they commenced to roll in the landings—that is, the piles of logs along the banks that had been hauled out in the winter. The landings often extend across the stream, only having a small opening in the middle, into which the logs could be rolled one after the other as they are floated out by the water. At the beginning it is slow work, the night being cold, the water runs off. In the morning there is little or none, but as the sun gets higher and the day advances, it increases, perhaps too much, and the men have difficulty in keeping the logs moving

F. E. Sayre & Company's Mill, St. John N.B.

Miller Brother's Mill, St. John, N.B.

without jamming, and may be forced into the icy water up to their hips to free an obstruction. In a few days the landings are all in and the start made. Provisions and camping outfit are loaded into the tow-boat, and away they go on their long march down river to the booms below Fredericton. No shear booms existed to guide the logs past bars or rocks and keep them in the channel. No corporation drives were ahead caring for their logs and hurrying them on to their destination. The crew that started with the logs must take them all the way through. At the same time other operations were being driven into the main river. At once you ask how did the different operators know their logs? They were all marked in the woods with an axe, cutting some characters through the bark, each operator having his own mark. These marks, while intelligible to a lumberman, mean nothing to the ordinary citizen. Some of the marks were "Wild Goose," "Beaver Hat," "Square Forty," "Turtle," "Shad Tail," etc., etc. I could talk an hour on marks alone and make it interesting.

The start once made the crew is strung out on both sides of the river, pushing the logs off the shores, where they may catch. Ahead the best men are watching the bad spots where jams might occur, and from time to time are called upon to run out over the floating lumber in swift running water and with pole or peavie dislodge the key log in what might in a short time be a serious jam. Hourly they risk their lives at their work and think nothing of it, but they are heroes, these Canadian stream drivers, and the best specimen of men the world can produce. Did they not prove it in the South African war?

The rear of the drive is brought up by the bateaux crews, and the boss who takes care no logs are left behind, the boats being used to carry them to one side of the river or the other or onto the islands. At the beginning there is not much work for the horses and they stand in a flanger or the tow boat and are passengers. The drivers start their work at daylight. As soon as they are off the cook and cookee break camp and get under way in the towboat, now running with the current and guided with the long sweep at the stern through the workers to the camping ground for the night, where the tents are once more set up. They are not the wall or circular tents we know, but long shed tents open in front and sloping down to the ground at the back. The cook starts his fire, makes his bread in the reflectors, boils his pork and otherwise prepares the evening meal. An abundance of wood is gathered to start a long fire in front of the tent. As daylight fades from the sky the men come straggling in, most of them wet to their waist, eat their meal and throw themselves on the ground under the tent behind the fire and are asleep in jig time.

Saving Stranded Logs

As the drives get farther down river more logs are found stranded along the shores and logs of other operators mixed with theirs, and the horses are put to work hauling them into the water again, commonly called sacking. As every crew is working independently, the marks on the logs are watched carefully by the men and boss to see that only the logs belonging to themselves are handled.

Often one crew would overtake an other on the river, when an effort might be made by the crew catching up to drive through, or possibly the crews might join forces and bring the two drives along together, the expense being shared by the operators in what they considered a fair proportion.

At Grand Falls all the boats and equipment had to be transferred from the upper to the lower basin. It was perhaps the first chance the men had had to get rum since they had gone into the woods in the Fall, and there were many sharks about ready to take their money. No wonder there were many wild times at the Falls when the drives were coming out. Every boss was thankful when he got his crew started below the Falls and away from further temptation.

Day after day the drive continued, the water always getting lower, the days hotter, and the sack heavier—men getting footsore or worn out and obliged to quit, when they would fasten a couple of logs together into a catamaran and on it float down the river, navigating it as best they could to Fredericton or their homes. Between the first and middle of June the drive would get in to the boom, a weary party, a mere remnant of the crew that had broken the landings, but triumphant, for they had not "hung up."

At Fredericton the bars and lumbermen's boarding house keepers stood ready to fleece them, and many of them were soon parted from their hard-earned money.

The First Booms

The first boom was situated where the Glasier boom is to-day at what was then called the "short ferry." In the earliest times there were no booms but boats manned by expert river men watched the river day and night from Cliffs Point above Fredericton to the Short Ferry below, and towed into safety any spars or timber that might be floating down. An act to incorporate the Fredericton Boom Company was passed on the 13th of April, 1844, in the seventh year of

Queen Victoria's reign. The incorporators were: John Glasier, Stephen Glasier, James Taylor, William J. Bedell, Jacob McKean, Isaac Kilburn, Duncan Glacier and Sjaafford Barker. The objects as expressed were: picking up, securing and rafting timber, logs, masts, spars and other lumber.

The capital of the company was £2,000 or \$8,000. There was a double liability clause in the charter and the rate fixed by charter for rafting logs was two shillings and sixpence per thousand.

As first constructed, there were no jam piers in the boom, but small sunken piers with chains and buoys attached to which the log boom was fastened. This style of boom continued until 1863 when the first jam piers were built, the old method not having proved secure with the increased quantity of lumber.

The second boom to be built was the Sterling, then the Gill, and last of all in 1878 the Douglas Boom above Fredericton. There were no sheer booms. Ordinary chain boom was used to sheer the logs as far as possible, the open gaps being watched by boats.

A few years before the incorporation of the Boom Company the Glasiers undertook the securing and booming of the lumber on the river, but they got into financial difficulties and just previous to the formation of the company it was being done by John and Isaac Burpee.

Before following the lumber further, I will describe the method of logging and stream driving as conducted today with the improvements we have over our predecessors.

Levi Pond's Invention

In 1876 Levi H. Pond, an American from Michigan, came to Fredericton to demonstrate to the lumbermen a shear boom that he had recently invented, and that was then being used in his native state, with the expectation of selling his rights.

The purpose of the boom is to direct the run of logs in a river so as to always keep them in the channel and to prevent their piling up on bars, heads of islands, rocks, etc., etc., also to direct their flow into booms, and adjustable, so that the river can be quickly opened to allow the passage of all kinds of craft and promptly closed again. The lumbermen of the day realized that if he could do all he said his invention was most valuable and would be the means of saving much money and time in stream driving and the securing of the lumber. A trial boom was built and experimented with in the river and proved every claim that was made for it. Immediately a company was formed to build and operate shear booms on the river, paying the inventor a royalty on every thousand of lumber that ran past them. The Fredericton Boom Company also agreed to pay the inventor a royalty for their use and this company continued until the patents expired. Mr. Pond made his home on the river until his death, a few years ago, and was continuously a contractor in connection with driving or the operation of his booms. This in short is the history of Pond's Patent Shear Boom, the best invention ever produced to assist stream driving, and now used in every country. The principle of the shear boom is exactly the same as that whereby a sailing vessel tacks or beats to windward. Instead of the wind, we have the water of the stream constantly flowing in one direction; instead of the sail, we have the rudders of the boom adjustable as the sails of a boat—we call them fins.

A Great Aid to Driving

Now the object of the boom is to direct the course of logs in a stream. To accomplish this we have extended out from one shore, in a slanting position down river, a boom along which the logs can slide as they strike it, flowing promiscuously down the stream, to the end of it, thus being carried across the river to clear an obstruction such as a rock or island. How to keep the outer end of the boom in the desired position out in the river, without the aid of anchors or lines, is the trick. To do it a string of logs is made, the ends lapping over one another shingle fashion, so that a surface without obstruction is presented to the floating logs, the first boom log is made fast to the shore by a strong chain, the string logs are toggled with chains and on the down river side at each toggle a half log or deal is hitched in at one end—this is called the Fin,—and by setting the whole number at the same angle to each boom log holding it in place by a stout spar each acts as a sail in the water and each does its share towards shoving the outer end of the boom up river as desired. The boom resembles a lot of letters "A" strung together by one side.

This is the simplest form of boom and the one commonly used in stream driving. A more elaborate boom is used at Fredericton, where the channel of the river has to be opened and closed many times a day. There a boom three or four logs wide of flatted timber is made and the fins are hinged on one side of it, and instead of being held in a fixed position by a spar are connected by a wire rope leading to a winch at the shore end. When the cable is slack the fins lie flat beside the boom and the whole thing tails out in the current. By tightening upon the cable with the winch the fins commence to separate from the boom and the lower end is forced out into the

stream by the water striking the fins—a simple contrivance now to all of us.

First Log Driving Company

The driving of each operation into the booms individually being an expensive undertaking and unsatisfactory it was decided that the driving on the main river from Grand Falls to Fredericton might well be done by a contractor who would get busy as soon as logs commenced running in the river in the Spring and keep at it, driving all the logs until they were in the booms. So an Act to incorporate the St. John River Log Driving Company was passed April 2nd, 1886. The incorporators being: Fred Hale, Wm. Tidlie, W. H. Murray, John Kilburn, Walter Stevens, W. Giberson, E. L. Jewett, J. Hayward, D. Nixon, A. F. Randolph, J. S. Leighton, Israel Merritt, C. Hagerman, B. Hume, Thos. Phair, George R. Burt, Robert Connors, Isaac H. Page, Franklin Stetson, George B. Dunn, J. F. Richardson, David Keswick, C. F. Woodman, W. H. Cunliffe, George T. Baird, Adam Beveridge, Jas. Yerxa, M. Nadeau, Fred Moore, W. F. Fowler.

This company continues today. It was not a stock company but a mutual organization whereby the driving of all the logs in the main river was done by a contractor at a fixed price from the mouth of certain rivers below the Falls, the price being according to the distance driven.

Robert Connors was the first contractor. By this method the cost of driving from the Falls to Fredericton was reduced 75 per cent. This Corporation driving having proved so successful in the year 1891, the Madawaska Log Driving Company was formed to drive the logs from the mouth of the Allagash to Grand Falls on similar lines, and last Winter another company was formed to drive from the mouth of Baker Branch to Allagash. So that now practically the whole river will be driven by Corporation drivers and not by individual operators as it was years ago.

Today most of the logs are cut by jobbers. These are countrymen who live close to the scene of the operation, who agree to cut and haul to the landings at a certain price per thousand. There may be big and little jobbers. The larger ones hire men and horses as may be required and have camps of considerable size, housing thirty or more men very comfortably. The small jobber, and he is in the majority, goes into the woods in the autumn and builds a camp divided in two parts, one end of the camp being occupied by his horse or team, the other by his crew of three or four, probably his half grown sons. This crew usually goes home on Saturday night to come back on Monday laden with cooked provisions for the week, principally a big pot of beans and bag of bread. Their camp is usually dirty and cold and the workers are ill fed, for all work logging and no time or care is given to the camp.

In other cases the whole family move into the woods to camp for the winter and the mother looks after the welfare of her husband and boys in the camp. These camps are quite homelike, especially if you find in it a baby swinging in a cradle made from a flour barrel.

This method of lumbering is most advantageous in the Province of Quebec, when short logs are cut suitable for the English market.

At the Depot Camps

The outfit of the operator being a Depot Camp where provisions are kept to be distributed to the jobbers as required and a staff of scalers and markers who continuously move about among the jobbers measuring up their logs and paint-marking them, also inspecting the quality and otherwise supervising. At this depot provision must always be made for the housing of men and horses, so that if a jobber for any cause quits work, men and horses can be quickly got together to get his logs to the river.

These depot camps have a sleeping camp for the men, cook house and eating camp, hovel for the horses, granary, blacksmith and carpenter shop. The cooks have a great boiler plate stove with all the regular kitchen utensils, and whereas in olden times pork and beans were the main diet, now the bill of fare is superior to what most workmen have in their own homes. Fresh beef and potatoes, pies, doughnuts and all sorts of cake. Butter and sugar are always in evidence.

At these camps boats are built, peavies and poles made, sleds mended, horses shod and provisions received from the portages.

The Boss has a small camp called the "Beaver House," which contains the wagon and office as well as sleeping quarters. If there is no logging done from this camp it is a sleepy enough place at mid-winter after the jobbers are well started for a short time, but soon preparations for the drive go on from day to day and men commence coming in for it and the hustle begins. This camp is usually connected with the outside world by telephone.

Although the jobbers cut the logs the stream driving is done by the operator with down river men. The natives are not usually as good river drivers, besides every day's drive takes them farther from home, and a longer distance to walk back, while every day's drive brings the down river man nearer home. So while the natives are employed in breaking in the landings and perhaps driving a little way, they never continue with the drive to its termination at Big Rapids.

In the State of Maine the logs are cut the full length of the tree. They are too heavy to handle with a single horse and require more strength to load and unload than the little Quebec jobber I have described has in his outfit. So we have these camps of forty to eighty men well housed in high light camps, heated with large stoves, the cook house being separate from the sleeping room. Plenty of light at night, with songs, stories, books and newspapers to pass the evenings.

Logging Engines and Trains

In many of these operations logging engines and trains of sleds have been used for several years past. These engines on a good ice road can haul immense loads of logs and have made it possible to get logs so far removed from the stream as were impossible with horses, or the logs can be hauled farther down a stream to bigger water where the drive would be much more sure. The jobbers on the American side are men with larger crews and are more in the class with contractors.

There has been little change in the method of driving, but dams have been built to conserve the water and dynamite is freely used to break up the ice in the lakes and dead waters, besides rocks innumerable, that would be likely to create a jam have been blown up in the main river and smaller streams.

At Big Rapids, 230 miles above Fredericton, the drive ends. The drivers continuing down river in their flangers to the railway at Connors. Some may even go as far as the Falls before they abandon their boats.

From Big Rapids to Fredericton the Corporation Drives handle the logs. From Big Rapids to the mouth of the Allagash, which is above the Madawaska Log Driving Company limits, the logs have been driven by a private contractor and from Allagash to Grand Falls by the Madawaska Log Driving Company.

Below Big Rapids shear booms are in evidence everywhere, guiding the logs from bad places and keeping them in the channel. The driving is done by crews on sections who drive their particular part of the river, then tow back or load their outfit on the train and get back to their starting point, driving down again and again so long as there are any logs to drive and water to permit.

This year the Corporation commenced at the mouth of Baker Branch, ninety miles farther up river than it has been the custom to start, the new company being called the Upper St. John River Log Driving Company.

Bridges Over River

In recent years bridges have been built across the river at Fort Kent, Van Buren, Grand Falls, Andover, Florenceville, Hartland, Woodstock, Hawkshaw and Fredericton. All these bridge piers catch logs and increase the work of driving and the delaying of the logs, but the greatest delay to the logs takes place at Van Buren. About nine years ago the St. John Lumber Company erected mills at this point, where the river is the boundary on the American side of the river, with a capacity of about forty millions a year, boomed the river, and since that time have stopped all the logs, sorting out their own and passing the others on. This delays the drive below Van Buren fully four weeks, the logs being turned out on a much lower pitch of water than when they are stopped at the sorting booms.

The establishing of this sorting boom, we believe, is in direct violation of the Ashburton Treaty, which says that the river shall be kept free to both nations for all time.

Much friction between down river lumbermen and the St. John Lumber Company has ensued during this stoppage of their logs. On one occasion the drivers on the river came to blows over the matter. About four years ago the governments of the United States and Canada appointed a Commission to deal with the matter, who up to the present time have made no report, and don't seem likely to in the near future.

The loss to the lumbermen of Fredericton and St. John is very great by reason of their logs being delayed, and it is a shame that the Commission has not reported before this, for their decision must be to give the Canadians more rights than they are now enjoying.

The tendency of the times is to manufacture as close to the stump as possible, so in recent years one tributary after another has been dammed and manufacturing plants established so that logs no longer come into the main river where this is done. Over half a century ago Alex. Gibson closed the Nashwask. Since then the Meduxnick, Becaguimac, Aroostook, Big Madawaska and Fish Rivers have been closed. Only a portion of the cut from Tobique comes into the main river and it would have been closed if it were not a salmon spawning ground, for bills authorizing the building of a great dam on this river have been introduced in the Legislature from time to time, but always thrown out by that body.

Conditions Getting Harder

Conditions on the river are continuously getting harder, the cost of getting logs to St. John going up continuously and year after year

the quantity getting smaller. The time will come when no mills will exist in this city.

Now let us get back to the booms: The shears at the booms skim everything that floats off the surface of the whole and when the drives are in the whole cut of logs are jammed between the piers and the shore like nails in a keg mixed with shingles, refuse from the mills up river, old trees and any culch that will float. To sort them out and raft them, each mark by itself so that they may be delivered to their owners, is quite a task. Each lumberman has filed with the Log Driving Company a list of his marks and the separations he wants. From these statements the mark book is compiled and carefully studied by the catch markers, who must be young active men with experience, and to whom is entrusted the work of re-marking the logs with a marking iron with marks that will designate into what joints they are to be put.

The sorting works consist of two log flat booms say one-quarter of a mile, on which men can travel, arranged parallel with the bank of the river, say 70 or 80 feet apart, and at the down river end narrowed for a considerable distance to about 40 or 50 feet spanned by foot bridges at intervals. At the lower end the loading machine is placed.

Now we will go back to the boom full of logs, between two jam piers or just below a taut line is stretched 4 or 5 feet from the water and forty or fifty feet long, above and below it at a convenient distance stages are arranged from which the logs can be easily poled along. The catch markers stand on the moving logs that are being sorted turning them over with their calked boots, their left arm over the taut rope to prevent their falling into the water. In their right hand they hold their marking iron. Immediately they see the woods mark they stoop down and cut in it with their iron a new fresh mark and that is quickly made and designates where it goes.

How Logs are Sorted

Along the long flat booms that I have mentioned men are stationed at intervals, called hitchers, who watch the logs coming past them and pick out the logs with the catch mark they have orders to look after, drawing them in sideways to the boom they are standing on. With a mall a wooden wedge is driven into the log about the middle. A small line is fastened to the boom and hitched to the wedge, a second log outside the first, then a third and so on until about forty lie orderly side by side, a small line holding them together and in their place. Marks that are running thick are hitched close to the sorting gap and farther down the marks that are not so frequent. As the logs run down this quarter mile stretch that I have mentioned they get fewer and fewer and by the time you get to the end all the logs are sorted. Probably there may be a stray mark for which no provision is made among the hitchers. This would be run into the grab-all to be assorted later. The culch passes on through the works, being hurried as quickly as possible by the men. As soon as thirty-five or forty logs (enough for a joint) have been hitched they are cast off from the boom and they are allowed to float down to the bottom markers. Here four men quickly drag two boom poles 25 to 30 feet long across the hitched logs, one at each end, as far as they will go, which will be five or six short of the whole number on the line. Immediately the poles are cut off an even length and with long augers holes are bored through the boom pole and into the log below; then hardwood pins are driven through the pole and into the log, tying them together. As soon as this is complete they pass to the next crew who quickly take off the line and in the water is a complete bottom with five or six loose logs of the same mark beside it. On they go to the loader.

The loader is the machine used to put the tier of logs on the joint above the boom poles, called the riders. A donkey engine on a scow securely moored alongside the boom does the work. From a high pile at the end of the scow a wire cable leads to the shore with a pretty sharp down grade; on this cable is mounted a travelling block that is attached to the drum of the engine by a line that will haul it up the grade. On the opposite side two chains are fastened, the ends being secured to a float with an apron on one side, anchored securely in the channel down which the bottom is coming. The bottom is pushed to the side of the float under the apron that extends well out over the joint, the block is let go from the drum, it slides down the inclined wire until it and the chains are submerged. The loose logs that are to be the riders are pushed to the side of the float opposite the bottom over the submerged chains. Immediately the engine is started pulling up the running block and rolling the logs over the float and apron onto the bottom in the chain parbuckle. Men with peavies straighten out the logs to evenly distribute the weight and the joint is complete.

It is now scaled or measured. The length of each piece is measured, the diameter at the top end taken, and from a table authorized by the government, the superficial feet are made up. The number of the joint and the number of the pieces in it are cut in with a marking iron.

The rafting is now complete as far as the Log Driving Company is concerned and the freighter takes charge of it.

Rafting by Farmers

In addition to the logs that come through the booms many logs are rafted by farmers along the river as they pass their homes and run to Springhill where the Log Driving Company pays for the rafting and hands them over to the freighters. Springhill is also the market for bank logs cut above Fredericton, that is, logs that have been cut by farmers along the river, rafting at the landings and run to Springhill for sale.

In the logs coming through the booms there are quite a number of logs that have no mark, or the marks have been so obliterated in pounding on the rocks coming down river that they cannot be read. These logs are rafted together, sold at public auction and the proceeds divided pro rata among the operators having logs in the boom.

Before the days of steamboats, logs, spars and timber were brought down the river by hand, the men propelling the raft with scull oars and long sweeps. They tented on the raft and cooked on it. Their progress was slow for they had to tie up if there was any head wind and in the Reach they could not work their rafts against the flood tide.

Steamboats have been in use for towing on the river ever since the formation of the Boom Company and probably a few years before.

It is the duty of the freighter to take the single joints from the boom, bracket them into the large rafts you see on the river in the summer, and deliver them to the mills at Indiantown, or to the holding booms. Since the very beginning of freighting with steamers the Glasiers and Tapleys have been identified with it. It was begun by Duncan Glasier, his first steamer being named the "Transit," a small boat that was built and operated for a short time in St. John as a ferry, but on account of the difficulty there was in starting and stopping the boat she was not a success and was chartered or purchased by the Glasiers. The second boat owned by the Glasiers was named the "Taratint," and I understand that some portions of her engines are still in use in the tug Lilly, of the Glasier fleet. Six or seven years later David Tapley went into the business with the steamer "Magnet." In 1866, he was succeeded by the firm of Tapley Bros., who previously had been only surveyors and caretakers of lumber, they combining the freighting of the lumber with the business they then had. Up to the present time all the towing from the booms has been done by these two firms, although the pioneers and founders of the firms have passed away.

The Main John

It is said that the expression "The Main John," as applied to the head of any business, and which is common throughout the United States and Canada, originated in the early days of the Boom Company, when three Glasiers, Duncan, Stephen and John, were active in the work. John was the boss and to designate him he was called "The Main John."

In the early days of towing all the boats were side wheelers, the propeller being unknown, but today the propeller boat is the most popular and efficient for this kind of work.

On arrival at St. John the logs are usually surveyed by independent scalers, whose scale is final and binding between buyer and seller. Among the first scalers licensed by law for this work were:—James Reynolds, Moses Tuck, Joseph Lingley, David Tapley, James Holly, Charles Eagles, John Coleman, J. E. Lingley, John Tapley.

The firm of Tapley Bros. I have already mentioned as scalers. One other firm became prominent in the work. I refer to McLellan & Holly, composed of David McLellan, later Provincial Secretary, and James Holly, a member of the Legislative Council when it voted itself out of existence. The firm still continues as James Holly & Sons, although the founders are gone.

First Steam Mill

The first steam sawmill in New Brunswick was situated on the Straight Shore about where Miller Bros.' mill stands today. It was built by Allan Otty and R. W. Crookshank and started on the 26th July, 1822, in the presence of Jarvis Knight, Governor of Nova Scotia, and General Smith, who was in command of the troops at St. John. Previous to this time there were tide mills. One was at the Carleton mill pond where the winter port docks are now, the water being held in the mill pond when the tide receded to be utilized in the turning of the mill wheel. Another was at Cunabel's Point, now the site of the pulp mill. To operate this mill a channel was cut through the point 300 feet long 60 feet wide and 25 feet deep. This channel was cut by the Mill Canal Company, Moses H. Perley, Secretary. It was started in July, 1836, and finished in the spring of 1837. The same company operated the mill.

These tide mills only cut logs for local consumption. The first mention of spruce deals being shipped was in the year 1822, the year the first steam mill started, and they were shipped by schooner Amelia to Cork. They were cut by hand. Very little sawn lumber

was shipped after this until the fifties when the Crimean closed the Baltic to Great Britain; as previously mentioned, In the late fifties and sixties there were a great many steam mills built and the export of sawn lumber increased very fast. At the same time shipbuilding was at its height and St. John was most prosperous and grew very rapidly, the lumber from the mills being shipped in home built vessels to all parts of the world. At that time St. John was the fourth largest ship-owning port of the world.

Some of the mills in operation at this period were:—

Kirk & Warrels, at the Long Wharf.
Briggs Mill, where the Hilyard Mill now stands.
Anderson Mill, near Rolling Mills.
Petree Mill, Straight Shore.
Flewellling Mill, Straight Shore, below Warner's.
Shives Mill, Straight Shore, below Warner's.
Brown Mill, where Murray & Gregory's Mill now stands.
Two Mills (Rankine) where Indiantown Mill is.
Rivers Mill, below Boar's Head.
Millidge's Mill, at Millidgeville.
Drury Mill, at Drury Cove.
Jewett Mill, at Millidgeville.
James Vernon Mill, Grand Bay. Also one at South Bay.
Holt Mill, at Randolph.
Lingley Mills, at Mosquito Cove.
Baker Mills, below Pleasant Point.
Barnhill Mill, below Pleasant Point.
Rivers Mill, below Pleasant Point.
Hunter Mill, where now Miller & Woodman.
A mill at Union Point, later Cushing's.
Goddard Mill, Union Point.
Wetmore Mill, Westhead Eddy.
Clarke's Mill, Carleton.
Burpee & Adams, Carleton.
Calter Mill, Carleton.
Adams Mill, Carleton.
Robertson Mill, Carleton.

The Modern Mill

The equipment of these mills was entirely different from the modern mill of today. The boilers were what are called shell boilers, sometimes as long as 40 feet and 3 to 3½ feet in diameter without tubes. They were fired underneath only like a pot, at the front end with wood and half way of their length with sawdust. It took six to eight men to keep up the fires. The engines were without cut-offs or any appliance that meant economy of steam. Most of them were slow moving long stroke and drove the main shaft of the mill by an immense cog gear.

The slip was a broad apron and the logs were hauled up by a long chain and wrappers. On the bed the wrappers were taken off and they were rolled to the gang, or single saw, with peavies. If they were cut in two it was done with cross-cut saws. The single saw was one saw working up and down with about a four foot stroke. The logs were rolled on a long frame that moved on rollers set in the floor past the saw, the log being set to get the required thickness, with crowbars at either end and dogged in desired position by sharp bolts driven into the end. On this machine at the time I am talking about were cut the largest logs. The feed was what was called the hitch feed, every time the saw went down by a cogged wheel and ratchet, the carriage was hitched forward about an inch. The saw never struck over 200 clips to the minute.

Then they had the live gang, a ponderous structure moving a sash up and down, carrying eight or ten saws. The logs were rolled on two carriages running on a track; sharp teeth in the jaws of the tail carriage held the log in place and it was shoved into the gang. Great weight rollers held it in position on spiked feed rollers underneath. When the sawn end emerged on the opposite side of the gang it was clamped into a second carriage similar to the tail carriage, and when the log was completely cut, was rolled out a few feet and barred onto skids by the edger.

This gang had the same hitch feed as the single saw. A few of these gangs are still in use, but they now use a continuous friction feed and the saws are hung with an overhang.

The edger was a single circular saw past which a long table was hauled by hand; on it the cuts from the logs were thrown two or three high. The first cut took off an edging and straightened one side; then they were turned over and set to the desired width, and the second edgings taken off. Very few laths were made, and the refuse from the mills was a burden. Everybody burned wood. Wharves were built of edgings and refuse, particularly in Carleton, and considerable was burned at the mills. There was no economy of labor in the mills in those days; every operation involved the hardest work and heavy lifting.

About 1868, Robert Thomson, who was then a young clerk in

his father's office, was sent to Cuba to look into the possibility of manufacturing sugar boxes for the planters. The Cushings had been making them in a small way for a few years. The result of this visit was ten to twelve years of the greatest milling activity St. John has ever seen. Every mill put in box machinery and commenced making sugar shooks about October, and kept at it night and day until April, when they would go back to their regular deal sawing. These box shooks were made from the coarse pine logs that previously were not considered worth cutting. They did not have to be dry, as the sugar was sold gross weight, box included, and the wetter the box the better. Trade with the West Indies was at its height and a large fleet of schooners was employed in the trade. By 1880 this business had practically come to an end, as the planters commenced putting their sugar into bags. The last cargo of shooks shipped from St. John was in 1884.

The American Mills

Until two years ago, when the section authorizing it was repealed by the United States Congress, logs cut in the State of Maine could be manufactured in St. John and shipped into the American market free of duty, provided the logs were cut by an American citizen, manufactured by an American citizen in an American-owned mill. This meant the coming to St. John in the sixties and seventies of Americans who established milling industries here and the manufacturing of large quantities of logs, cut in the State of Maine, in St. John. Today some of the mills are owned by sons of these gentlemen.

Future of the Mills

The mills cutting logs today in St. John are fewer in number than they were in the past, and will not increase. The distance the lumber has to be driven, the increasing difficulties in the driving, and the high cost of labor go a long way to offset our modern equipment and the splendid shipping facilities, and I feel quite safe in saying that there is little probability of any sawmill being re-built in St. John that is destroyed by fire. Most likely it would be re-built on the line of railway closest to the timber limits.

Our sawmills today are equipped with economical tubular boilers that one man can fire automatically where six or eight men were required. We have hand saws and stock gangs taking only one-half the saw kerf the old gangs did; patent edgers that take care of the lumber as fast as it can be put in; endless haul-ups that feed the logs into the mill in a steady stream, kicked right or left by machinery as required; jump-up saws in beds that will cut a log in two in a jiffy; steam canters to roll the logs on the saw carriages; transfer chains for moving the lumber and edgings; automatic machines for cutting up the edgings; re-saws, lath machines, and many other small machines for manufacturing the wood that formerly went to waste. Nothing is now burned under the boilers but sawdust, and no wood is wasted that is sound.

In the modern mill it is not a question of brute strength, but sleight and expertness in the performing the various operations.

The milling season in St. John is properly about eight months—from the 1st of April to the 1st of December—earlier or later; you have frost to contend with. Sometimes mills undertake to run in the winter time. Such mills, to do so successfully, must have a southern exposure, and be situated where the warm salt water eddies about their slips. The logs must also be piled in floating piles about 8 feet deep, so that the bulk of the logs are below water where the frost does not get into them, as frozen logs are difficult and slow to saw.

The mills in St. John today are:

	Capacity Per Year about
Randolph & Baker, Limited	19,000,000
Charles Miller	9,000,000
John E. Moore	9,000,000
Stetson, Cutler & Company, Indiantown	16,000,000
Stetson, Cutler & Company, Pleasant Point	10,000,000
Murray & Gregory, Limited	12,000,000
James R. Warner & Company	10,000,000
Miller Bros.	9,000,000
Hilyard Bros.	10,000,000
F. E. Sayre & Company	8,000,000
Total	111,000,000

In addition, there is the Partington Pulp & Paper Company, using 14 or 15 million feet a year, and John E. Moore is building a mill at South Bay designed for the cutting of small logs. Thirty years ago the milling capacity was nearly double what it is today.

The lumber manufacturers of St. John have not made a practice of shipping their lumber to Great Britain in their own name. There is a feeling that when they have cut the logs in the woods, got them sawn and piled on their mill wharves, they have followed it far enough, and it was time to give someone else a chance, besides it would take larger capital than most of them have to do it successfully, and

the loading of a steamship, such as we have today, from any one mill would be impossible without great congestion.

How Lumber is Shipped

We have in St. John several branches or agencies of British timber houses, well equipped with lighters, who buy the lumber on the mill wharves as cut, load the lighters and deliver it alongside the vessel. They also purchase large quantities that come in on cars and by small schooners from outports. These are first put in the steamers, and the city mill yards are used for the sorting up of the cargoes. City-cut deals are better manufactured than the country deals and usually command a better price. It has been said that mixed cargo of this kind is sold by the shippers as city-cut, which is hardly fair to the manufacturers.

There has been a great change in the size of the lumber shipped in my time, thirty years. The specification then called for 10 per cent. seven inches, and 90 per cent. nine and eleven inches. Today the usual specification is 50 per cent. seven and eight inches, and 50 per cent. nine and eleven inches.

The net profit to the manufacturer is dependent very largely upon the freight rate, which has fluctuated from 25 to 70 shillings per standard within three years. The British market does not require as long an average length as the American. On the whole, it has been the most profitable for a good many years, as it is not subject to the sudden fluctuations the American market has.

The mill owners shipping to the American market usually ship their own lumber in schooners consigned to some reliable commission house. In the American market the fluctuations have been very marked. A cargo might be loaded when there was a good market, and before it reached its destination the market might be flat, a fair wind and the arrival of a fleet of lumber-laden vessels being sufficient to demoralize it. In recent years the shipments from St. John have been decreasing, and so has the fleet of schooners. Should we wish to take advantage of the proposed removal of the United States duty on lumber it will be necessary to rebuild a coaster sail fleet or a fleet of suitable lighters to be towed by ocean tugs, and even if there is no difficulty in getting tonnage I do not think there will be any great increase in shipments to this market from St. John because our own domestic consumption is getting greater all the time, and we have a new market in Upper Canada that is growing.

Operations of the Past

I might give a short biographical sketch of many lumbermen of the past whose names are familiar the whole length of the river, who have done much pioneer work in opening up the province, and whose operations have given employment to thousands of men when it was badly needed, but time will not permit; yet I must mention the fact that Glasier Bros., John and Stephen, were in their time the largest operators, and the first to go above Grand Falls for pine timber. In more recent years we had the late W. H. Murray, who cut more logs on the river than any other individual or firm; his total cutting must have amounted to well over a billion superficial feet. No man on the river was better known; none more unassuming, approachable and kindly. Nor did any have the general knowledge of the business he had. The Log Driving Company, the Boom Company, the freighters, the manufacturers and the exporters all looked to him as the leader and for information to guide them in the conduct of their business.

In conclusion, I would like to call your attention to a few historical facts in connection with lumbering in New Brunswick. The first record of lumber cut in New Brunswick was in 1700, when masts were cut for the French Navy. In 1722 the British Government passed an Act prohibiting the cutting or destroying of white pine trees 12 inches and upwards in diameter on government lands, and in 1829 the same law was applied to granted lands. A little later, so great was the anxiety of the British Government to preserve the pine, that all pine trees suitable for masts were reserved to the Crown, and the surveyors or deputies were ordered to seize all pine timber found in the possession of any person, even if it were cut on his own lands. The fear was that masts and spars suitable for the Navy might become exhausted. The dreadnoughts and cruisers of today were not even dreamed of then.

There is a record of a lumber contract between Franklin, White & Hazen, of Margerville, and Franklin & Peabody, of St. John, dated 1781, in which Franklin, White & Hazen agree to deliver at St. John by first spring freshet the masts, yards, etc., mentioned in the contract.

The contract for the entire equipment of wet machines, pneumatic sawmills and screens and 12 centrifugal screens for the Abitibi Pulp and Paper Company has been obtained by the Sherbrooke Machinery Company, Limited. Mr. White, the manager of the Abitibi Company, is of the opinion that 20 heavy design two roll wet machines will be sufficient to handle the output of the company.

Are Lumber Employees Wages Low?

St. John M.P.P. Declares They Are Below the Cost of Living—Toronto Lumberman Contradicts This.

Editor Canada Lumberman: A recent copy of the Toronto World contained an article dealing with the average wage of the employees of lumber manufacturers in Ontario and Eastern Canada generally. The writer is Mr. Franklin Hatheway, M.P.P., St. John, N.B., who makes a number of assertions which I submit will not stand analysis. In the first place, referring to the average wages of the employees of lumber manufacturers in Ontario, he states that the yearly average per head is \$379, which is very unfair to the employers, inasmuch as his divisor is too large for his dividend, because the employees are shifting about from one company to another and every time they are entered upon a new pay roll they figure as a part of the divisor. The reader can very readily understand why the average would be brought down by this means of striking it.

Not many months ago a large employer assured the writer that, when he commenced in the lumber business it took from \$20,000 to \$25,000 to pay off the camp even at the Christmas holidays. At that time he would have on his pay roll approximately 300 men and this was when wages were ranging from \$14 to \$18 a month and board, as against \$33 to \$35 at the present time, whereas today he stated that his payroll had not less than 1,500 names on it and it only took from \$3,000 to \$4,000 to pay them off at Christmas which shows very plainly that the average struck by the writer of the article in the World is certainly misleading so far as Ontario is concerned, and I presume that the same will apply to Quebec and New Brunswick. There is considerable strife at the present time between employer and employee in the lumber industry at St. John, N.B., so much so that the mills are all closed down owing to a strike brought about by the river men. The article therefore, comes at a most unfortunate time. He makes another statement that is wide of the mark when he places the capital invested in the lumber industry of Ontario at \$55,000,000, the products of the year at \$54,000,000, and the material bought at \$29,750,000. Now the capital invested by the Ontario lumbermen would be more nearly represented if he multiplied his figures by 5, the products by 3 and the material bought by 2. Taking these figures as a basis and applying them to his profit and loss account it would show very plainly that his deductions are about as reliable here as they are on the wage account. In another part of the article he says, in the city of St. John, the average wage per day is \$1.80 and the workers are employed about 200 days per year which would make \$360 instead of \$268 as stated in his article. Again the scarcity of lumbermen in charitable institutions is a further evidence that the employer is paying the employee adequately, and the few who are so placed have been brought there through their own profligacy.

I shall leave the reader to draw his own conclusions as to the reliability of this article. It is a fact that the lumber manufacturers as a class are not making as much money to-day for the amount of capital invested and the risk taken as they should; and the millionaires he speaks of, have not been made so by the manufacture of lumber, but rather by the unearned increment on timber holdings. If the stumpage that is asked for and obtained by the government is used as a starting point and all disbursements added thereto until it reaches the market, it will show very plainly that in many instances the manufacturer is not getting a new dollar for an old one. The lumberman is subjected to all sorts of competition in selling his product. Everything that he uses from the axe that fells the tree to the rule that measures the lumber is protected, and when he has run his race in this mundane plane he is brought to his last resting place in a protected casket, drawn to the grave in a protected hearse, and the dead march is played on a protected organ whilst the product of his labor is met with unprotected lumber from all parts of the globe. The writer wishes it understood that he holds no brief for the manufacturer but rather belongs to that much abused class, according to Mr. Hatheway's idea, called the employee.

W. J. MacBeth, Toronto.

The article to which Mr. MacBeth refers in the above letter was published recently in the Toronto Sunday World and is as follows:—

I know that your journal is interested in the technical report which takes up the demand made by the Dominion Manufacturer's Association ever since 1900, for more efficient workers. Therefore, I lay before your readers some of the astounding revelations shown in bulletin No. 1, 1911 census, dated August 15, 1912. As the products from logs and from lumber employ the largest numbers under the head of manufacturers, I quote from pages 17-18 of about bulletin:

	Wage Earners	Amount Paid	Year's Av. Per Head
Ontario	26,963	\$10,215,982	\$379.00
Quebec	25,405	6,871,753	270.50
New Brunswick	9,061	2,428,119	268.00

Next to agriculture this industry quoted is the greatest we have especially so in these three provinces. The manufacturers are behind this technical commission proposal of an annual expenditure of \$3,350,000 for ten years, hoping thereby to develop more skilled labor. One class of employers, however, should remember, in the light of the above figures, that while they are receiving large profits, their workmen are wretchedly paid. How can a man, his wife and three

children exist decently on the Ontario average of \$379, and much more, on the \$268 average in New Brunswick.

The Result

What is the result of these meagre wages? The wife is forced to go out to the hardest labor-work, and leave at home her young children. And again it forces the parents, as the family increases, to stint the elder ones on clothes, and even on food. Also, they put these children out to work as early as possible, to help increase the \$379 average. One sure way to develop skilled labor is to give good wages—a living wage—so that the youth can take full advantage of our school system. Low wages mean poor, inefficient workers, who stupidly keep on working while realizing in a dull way that they are being wronged. Here at the fifth census, after nearly 50 years of the Dominion, we cramp and crimp these workers in saw mills and factories down to an average of \$379 per year in Ontario, \$268 in New Brunswick, and \$270.50 in Quebec. During that same cycle of fifty years very many of the owners have become rich, even into the millions. Happily for the workers in this class of manufacture, forces have arisen in the last ten years which insist that workers must get a living wage. It is not too much to demand that the workers who turn the raw log into the finished product for building houses, wharves, etc., should get enough wages to provide shelter, food and clothes, plus a reasonable amount for reading, rest and recreation, without being forced to send out their children to work before they have well gripped the fundamentals of education. This force is intimated in the closing remarks of Congressman Underwood, on the United States tariff, a few weeks ago.

"I give you notice now that if any manufacturer attempts in the interest of the Republican party to threaten labor, there is a bureau in this government, the bureau of foreign and domestic commerce, created by the Democratic party, that will go into the factory, make a thorough investigation and ascertain the reason why."

Applies to Canada

Manufacturers in Canada must take note of this for it applies to Canada at this moment. In their own interests the manufacturers of lumber should be satisfied with a 10 per cent. profit on their capital, and not screw 20 per cent. out of the people when paying their workers only the \$379 per year recorded. They want skilled workmen. They will never and ought never to get them on these wages. Their greed to make money blinds them to the fact that their workers are under-paid, and, consequently these 61,300 workers drudge along with no zeal for their work, and only hatred for their employers.

In my own City of St. John the press states that saw mills average \$1.80 per day, and the workers make about 200 days. For the rest of the year they pick up any odd work possible, some of which pays well. Our province average of \$268 per year is made low by the numerous small mills in country districts. Nevertheless our average of \$268, and Quebec's of \$270.50, are a disgrace compared to Ontario, \$379. Mr. Verville stated last May at Ottawa that a family of five needed to have \$900 a year to live decently, thus permitting the children to take full advantage of school benefits. No wonder the workers laugh scornfully when comparing his statements with their meagre wages:

In the hope to inspire manufacturers with the desire to pay higher wages, and to prevent those strikes by which the workers and the public suffer so much, I repeat here the opinion of Mr. Geo. P. Berett, writing to that capitalist magazine "The Outlook" of New York.

"Quite recently, in talking with men whose incomes come mostly from their investments, I have been struck by their feeling as expressed to me, of a change coming, or actually upon us—of a time when capital will be obliged to take less than its former share of the profits of production; and they attribute this coming change to the demands of labor, the strikes for larger wages and shorter hours, the accounts of which are continually filling the columns of our newspapers."

Asks for Living Wage

This labor man of the twentieth century stands here asking for a living wage. He is no Hercules, but a reasonable man, asking for food, shelter and clothes and the employers must give them. The old economic arguments based on Adam Smith, are preached from some college chairs at times but with rapidly diminishing force. "Supply and demand," may have some logic when there was no quick transport for labor, and no cables to wire capital around the world in twenty minutes. Just as syndicates and trusts can and do restrict outputs, and thus cause sharper demand, so does unionism restrict supply of labor by the cogency of conferences and the potency of strikes. Both are often hurtful to the great public, but of the two, the syndicate or trust does the most harm as it wields the giant mace of a very few, to wrest profits from the very very many. Whereas the union is at its base, an expression of that sermon preached nearly nineteen hundred years by Jesus, the son of the carpenter. The

"shadow of the cross" falls upon the floor and wall as Jesus rested a moment from his toil. These men who employ labor should study that picture of Holman Hunt's, and hesitate before they offer wages which produce underfed bodies, insanitary conditions, and vicious surroundings.

Senator A. J. Beveridge in his speech in the United States Congress in 1911 on child labor impressed deeply the shame and disgrace of labor conditions in the cotton and other mills.

Cost of Living

At Washington last May the International Kindergarten Union listened to Prof. Nearing of the University of Pennsylvania. He said:

"It requires a minimum of food and shelter and clothes to maintain life. The cost of these in an American city for a family of three children, and a man with wife, varies from seven hundred and fifty dollars to nine hundred dollars. An examination of the average rates paid American industry will show that approximately three-quarters of the adult males working in the industrial cities and towns receive less than seven hundred and fifty dollars in wages, and, therefore, presumably less than enough to support a family of three children in decency. In the United States there are thousands, and tens of thousands of children who are habitually hungry. A recent investigation in Chicago discovered fifteen thousand children of school age who did not receive sufficient nourishing food. Furthermore, many children lack shoes and clothing; many have no beds to sleep in. They cuddle together on hard floors. The majority of the indigent children live in damp, unclean or overcrowded homes that lack proper ventilation and sanitation. Here, in the damp, ill-smelling basements, there is only one thing regarded as cheaper than rent, and that is the life of the child."

And Miss Louise Bryant concludes her recent pamphlet with: "In New York and other American cities ten per cent. of the school population are seriously underfed."

Can Pay Better Wages

How do employers feel when they are faced with the fact that low wages have contributed so much to these conditions? There is no reason why Canadian manufacturers of lumber should keep on paying the wages given in bulletin No. 1 as quoted. That very bulletin shows that they could easily increase wages 10 per cent. and still get 10 per cent. to 15 per cent. for their money invested. Pages 17-18 show as follows:

For lumber and log products of Ontario—	
Capital invested	\$55,008,168
Products for year	54,307,021
Material bought	29,868,877
Let us make up a profit and loss account and see what the owners receive and pay out:	
Profit and loss account	Dr.
Material bought in year	\$29,868,877
Salaries, 1837 at \$920 per year	1,689,515
Wages, 26,962 at \$379 per year	10,215,982
\$55,000,000 capital at 10 p.c.	5,500,000
Insurance on carried stock and buildings, \$10,000,-	
000 at 5 p.c.	500,000
Annual repair to buildings and machines	300,000
10 p.c. increase to wages paid 1911	1,021,598
Balance for owners	5,211,049
	\$54,307,021

Thus, after increasing the average wage 10 p.c., equal to \$416.90 per head, and keeping 10 p.c. as interest on capital, they would still have a surplus of over \$5,000,000, besides paying all expenses. Of course, any new machines would be chargeable to capital. It may be argued that 10 per cent. is not enough for capital to receive as interest, but they could retain 15 per cent. and still have a good surplus. Capital searches in Great Britain to get 5 per cent., and 6 per cent. to 7 per cent. is considered a high return. Ten per cent. therefore should content any employer's heart, and 15 per cent. should make him joyful. Big profits such as 20 per cent. to 30 per cent. interest on investment must cease, and they the 61,300 workers in the lumber and factory business, will get a larger share of the value of goods manufactured. That which knocks the ambition out of a man is not so much the hard luck, and possibly real poor conditions for a week or a month. No, it is not that, but it is the consciousness that he never can get ahead, that his wages are not quite enough, and force him to send his little girls to the factory, or his boy to the coal cart, or the mill. Always to drudge along on a bare subsistence—it is that which kills patriotism, and finally defies law. Let the employer remember that vice and poor health are closely related to low wages and long hours. For his own future safety as a Christian, and for his present success as a business man, let him remember that he will never get good efficient steady work from persons who are poorly paid.

Your Kindling Pile as a Source

The constantly increasing high price of lumber has compelled many users to consider working material which before they have always rejected and due to its not being saleable, many manufacturers have thrown it in to the burner or cut it in short lengths and sold it as kindling wood.

Just take half an hour and walk through your mill and factory stopping at each point where the waste is accumulating and ask yourself, "Can this be saved so as to return a profit?" The man who is familiar with the Linderman method will thoroughly recognize how the waste at many points may be reduced 40 per cent. or even 60 per cent.

In the flooring mill where the hard and soft wood lumber is bundled, where defects are cut out leaving an accumulation of waste of various lengths whose ultimate destination is the kindling pile, fully fifty per cent. of this waste can be converted into flooring. It is true that this flooring is different from any that has ever yet been marketed, but still, owing to the advance in price, it will find a ready sale at \$2.00 or \$3.00 less than the standard price which will yield a vast profit over what can be obtained for it as kindling. The illustration shown above clearly indicates how this can be done. As all flooring manufacturers are thoroughly aware, there is more or less flooring having machine defects on the tongue and groove that prevents its being utilized, yet the face of the board would run as No. 1 or No. 2 grades. If these long lengths were saved instead of being cut up and then, if a number of short lengths which ordinarily would be cut up as kindling were saved, having the ends trimmed accurately and laid out so that their combined lengths would equal the long flooring pieces having defective edges, these can be united into a board 8 in., 10 in. or 12 in. in width and joined together on the Linderman machine so that the entire board has a strength equal to, if not greater than, the wide lumber. Such a floor as this would be very acceptable in all of the cheaper made houses in all parts of the country, where the contractors see that they can save several dollars per thousand. The lasting qualities of the board and its strength are equal to the one-piece stock or narrow widths. This product could also be used for partition work, sub-flooring, shiplap or sheathing.

CANADIAN LINDERMAN COMPANY

e of Profit Rather Than Loss

In the sawmills throughout all parts of the country there are thousands of feet being burned up daily of short length narrow width or edgings which, if a Linderman machine were installed, could be built up into wider stock and this wider stock sold to answer the same purpose as the wide one-piece lumber and give as good satisfaction, although likewise, this stock must be used in the cheaper grade houses and the product sold for a few dollars less.

In the West, particularly, where so much lumber is found having a false heart and narrow strips on either side 2-in., 3-in. and 4-in. wide which now are thrown into the burner, this stock can be ripped, then joined up on a Linderman machine and converted into common lumber or shiplap.

On October 18th last, we were sent a number of samples of 4-in. Saskatchewan spruce to join up for 8-in. shiplap. In returning this lumber we saved one piece as a sample, painted one side and left the other side in the natural wood. This sample we then stood on edge exposed both sides of it to the weather throughout the winter and brought it into the office on March 14th last. On the painted side, after having stood in a steam heated office for two weeks, it is impossible to discern where it is joined, the joints being tight and remaining tight the entire length of the board. On the unpainted side the joint is discernible only by the difference in grain and color of the wood. This is a five months' test of one of the most difficult of all Canadian woods to work and have it retain its shape throughout an open winter which would be harder on glue joints than our usual severe winter, proving conclusively that this product cannot only be used for shiplap or sheathing but can also be used for barns and all other buildings where wide lumber is used.

As a progressive manufacturer who desires to get the last cent. out of his investment, will you not take up your proposition with us and let us show you how we can make a saving for you that will figure from \$3,000 to \$15,000 a year?

Quebec's Remarkable Timber Resources

Thousands of Square Miles of Virgin White and Red Pine Awaiting the Lumberman—
Spruce Sufficient for Half the World's Paper Forever

By R. O. Swezey

A narrow strip of land extending from the lower St. Lawrence to Lake Temiskaming on the Ottawa and averaging less than five miles in width, represents approximately the inhabited portion of Quebec Province north of the St. Lawrence River. Of that same strip, by far the greater length is less than one mile wide and for hundreds of miles below Quebec the only signs of habitation are shown by a few isolated little groups of shacks. But for scores of miles the forests begin right at the water's edge. The largest portion of this populated area lies between Quebec and Ottawa; one quarter of the population of the whole province being found in the city of Montreal. It may be further noted here that even in the oldest farming country between Quebec and Montreal, the cultivated strip is only about forty miles at its widest.

North of and beyond this extenuated strip, there stretch for hundreds of miles towards James Bay and Ungava the greatest spruce forests in the world. Indeed it has already been stated with authority that if her forests are properly managed and protected, Quebec is capable of supplying annually five million tons of paper; equal to more than half the world's demand. Much satisfaction may be felt in considering the fact that although lumbering has been carried on for over a century on the Ottawa, St. Maurice and Saguenay rivers, there is not yet the slightest hint of forest depletion in those regions, though for the past four or five years the conservation cry has so persistently been put forth that the average citizen has become a dire pessimist in his views concerning the forests of this country. Of course, such an effect is a wholesome one, for the agitation which has produced it has thereby been successful in preventing many disastrous fires.

While large areas of Quebec's forests have been from time to time made to suffer severely from fire, the natural re-forestation process has maintained the devastated area at a comparatively low minimum. Apart from burnt areas, there are naturally some swamps and peat bogs, but there is no just call for alarm when statements are made that one-third of northern Quebec and northern Ontario is un-timbered or non-producing. Such conditions have always existed in the better known forests of the southern parts of these two provinces and no one became unduly alarmed for the density of growth on the good areas sufficiently offsets the so-called unproductive third. Even granting that one-third of the north forests are untimbered, the enormous area of the heavily timbered portions would astonish any lumberman. But the forest expert or cruiser who has not the time or the energy to leave his canoe or hand-car and plunge inland from rivers and railroads to investigate the forest conditions has absolutely no right to give an opinion on Quebec's forests, since the portions lying close to their railroads have been to a greater or less extent subjected to the results of carelessness in the use of fire. and woodsmen should know that good timber never grows close to river banks except in particularly well sheltered localities.

There are thousands of square miles of the now far-famed "clay belt" of Northern Quebec and Ontario. It comprises some of the most heavily timbered portions of the whole province, which may be said to be better adapted to cattle raising than any other part of Canada, for an acre there will grow more fodder than any two acres in Western Canada.

In Quebec the "clay belt" is penetrated by the G. T. P. and lies several miles on each side of it, extending from the west boundary to Bell River, a distance of 140 miles. There is heavy work to do in clearing the land for farming but just as soon as a good market is created for the timber and pulp wood, an enormous influx of settlers may be looked for and large farming areas will spread. Outside the clay belt from Labrador to Abitibi and from East Main River to the St. Lawrence, months of travel by canoe and trail in every direction carries one through virgin forests, lakes, rivers and mighty water falls. Many of the lakes and rivers are navigable, providing natural highways for economic development.

What may be regarded today as rich and permanent spruce forests lie in the Ottawa Forest Reserve, the St. Maurice and Saguenay and particularly in the Upper Peribonca region of the Saguenay Reserve. Of these vast regions only a small portion of the Saguenay

forests can ever be given over to agriculture, the others being entirely unsuited to farming, though ideal for timber growth. It should be understood, however, that the forests of the northern clay belt are quite as densely wooded as the forest reserves of the St. Lawrence slopes, but since the land is so well adapted to farming the forests cannot be regarded as permanent.

Two hundred and fifty miles north of the clay belt is the East Main River, which rises in Southern Ungava and flows westward to James Bay.

North of the East Main River there is no valuable timber. Scrubby spruce in river valleys is the best that the country offers. But coming southward from East Main River through what is known as the Mistassini region the conifers continue to assume some size and value until in the vicinity of Lakes Mettagami, Waswanipi and Chibougamoo River, one hundred and fifty miles north of

the Grand Trunk Pacific, the spruce and balsam attain a good pulp wood size, increasing gradually in size and quality to very large merchantable timber at a distance of some forty miles north of the G. T. P. where large tracts averaging from three thousand to seven thousand feet B.M. per acre are common.

The whole of this timbered area in northern Quebec lying north of the height of land is very well watered and lumbering operations for that portion which lies south of the railway are simple, but on the north side the fact that the streams flow towards James Bay and away from the railroad precludes any possibility of profitable lumbering in that part of the country until there are railroad branches extending northward down the valleys of the larger rivers like the Nottaway and Harricana towards James Bay.

White Pine in Enormous Quantities

In that whole region north of the height of land which divides James Bay water from St. Lawrence waters, there is practically no white pine but just south of the height of land in the Upper Ottawa region in with thousands of square miles of virgin forest, there are immense quantities of first quality of white and red pine awaiting railroad facilities to be taken out, while the pulpwood resources and water power facilities of this same region are simply enormous. Even on the Lower Ottawa on such rivers as the Noire, Coulonge, the Gatineau and Lievre, fifty years of lumbering has scarcely scratched the pulpwood resources. The same may be said of the St. Maurice region but at the head waters of this river, unfortunately there is a large burnt area which though growing up rapidly with spruce, will take at least 60 years to produce a good crop.

On the minor rivers falling into the St. Lawrence between the St. Maurice and Ottawa, there are timber limits within four hours travel of the City of Montreal which are, owing to their proximity probably the most astonishing in their richness. Here, there are to-day large tracts heavily timbered with excellent second growth white pine measuring as large as 15 in. diameter at the top of 60 feet and first quality spruce measuring in many localities forty to sixty feet of clear timber with a diameter of 10 to 12 in. at the top. Considerable areas will average 40 of such spruce trees to the acre.

Eastward from the St. Maurice, south of the height of land, dividing the St. Lawrence from James Bay and extending to the mighty Manicougan River, which falls into the St. Lawrence, there is an area, which includes the Saguenay forests of over 75,000 square miles in which the loss by burned and otherwise unproductive area is a minimum. Even at the head water of the Peribonca, Bersimis and Manicougan rivers, 250 miles from Lake St. John, the quantity and quality of spruce is unexcelled anywhere in the Province of Quebec. As there has never been an axe in the greater part of these 75,000 square miles some conception of the forest wealth may be had. Some parts of these forests are known to carry 40 cords of pulp wood to an acre.

From the Manicougan River eastward to the Labrador Coast conditions change however. No longer is the timber found on the high flats above the river valleys but vast barrens extending hundreds of miles into the lone north grow nothing larger than 2 inches in diameter. It is only in the river valleys that spruce is found at all of the

same size and quality as in Western Quebec. A glance at the map, however, will show that along the north shore of the St. Lawrence River for a distance of about 50 to 75 miles inland, the multiplicity of rivers naturally form valleys and favorable conditions for a large growth of spruce and balsam. The quantities of pulp wood along these rivers are enormous. Indeed most of the rivers as far north as beyond the Hamilton River contain spruce timber in their narrow valleys measuring 60 to 70 feet long and 10 inches in diameter at the top. These conditions do not obtain however for distances greater than two or three miles from the river banks and usually not half that far for the valleys are very narrow. Therefore in speaking of Labrador limits in areas of hundreds of square miles, it is well to remember how restricted the timbered area is. Moreover the fact that many of these Labrador and North Shore Rivers empty precipitously into the Gulf of the St. Lawrence precludes the possibility of lumbering them at a profit since there are no means of holding the logs at the mouths of the rivers.

Canadian Woods in London

Messrs. Churchill & Sim, London, Eng., in their monthly wood circular dated August 5th report as follows:—

From the St. Lawrence has been imported—

Pine Deals . . . 194,000 pieces against 164,000 pieces in 1912

Spruce Deals . . . 159,000 pieces against 255,000 pieces in 1912

Birch Planks . . . 118,000 pieces against 67,000 pieces in 1912

and from New Brunswick—

Pine Deals . . . Nil pieces against 50,000 pieces in 1912

Spruce Deals . . . 276,000 pieces against 212,000 pieces in 1912

Birch Planks . . . 252,000 pieces against 283,000 pieces in 1912

A small quantity of pine deals arrived during the month, and prices remain very firm. The importation of spruce is limited to half a cargo in all, the Lower Ports being practically shut out of the market owing to the continuance of the strike at St. John. Merchants' attention has consequently been diverted to what whitewood is obtainable from the North of Europe, and a small trade with the spruce ports has been the result. Some few parcels of hardwood planks arrived from Halifax, and met with a fair demand, but there has been no great anxiety to secure them, and prices remain stationary. Elm and yellow pine have not been in favor, and birch timber is also in small demand.

British Columbian and Oregon Pine.—The stock of long timber is getting small in the absence of fresh arrivals, and prices are, for the moment, higher. A large quantity of special sized wood has been used for contractors' work in and around London and the Coast, and Oregon pine has made some progress in popularity.

Farnworth & Jardine in their monthly wood circular, dated Liverpool, 1st August, report as follows: Business during the past month was of a quiet character, and disappointing in volume. The arrivals, with two or three exceptions, were moderate, but the deliveries again unsatisfactory, being in the aggregate about 15 per cent. below the corresponding month last year. Stocks of some of the leading articles are on the heavy side; but, generally speaking, they are not too large, and values are well maintained. Ocean deal freight rates are firmer. Canadian Woods.—Pine timber.—The arrivals have been very light, both to Liverpool and Manchester; the demand is inactive, and stocks are ample: Waney 1st class: imports were very small; the demand is quiet, but prices rule high; stocks are sufficient for probable requirements. 2nd class: several small parcels arrived during the month, but there is only a limited enquiry, and sales are difficult. Square pine.—No arrivals; with the absence of enquiry stocks are unchanged, and sufficient for probable demand. Red pine is seldom enquired for. Oak.—There have been no imports to Liverpool, but to Manchester about 29,000 cubic feet arrived on contract; the consumption has been satisfactory, and values are firm; stocks are light. Elm.—The arrivals entirely to Manchester have been more liberal, chiefly on contract, which will go largely into consumption; values are very firm. Pine deals.—The arrivals show an increase on the previous month; deliveries have again been disappointing, but stocks are fairly moderate, and values steady.

New Brunswick and Nova Scotia Spruce and Pine Deals.—The imports to the Mersey (including Manchester) amounted to 12,310 stds., against 9,000 stds. during the corresponding month last year, about equally divided between Liverpool and Manchester; the consumption has been only fair, but stocks are rather less than this time last year, viz., 18,610 stds., against 20,850 stds.; values for cargo specifications are firm, but for liner shipments a little easier. Ocean freight rates are firmer. Pine deals.—There is fair enquiry; prices are steady.

Birch.—Logs.—The arrivals, entirely from Quebec, have been moderate, and deliveries have kept pace; however, the demand is not active, and stocks, although moderate, appear sufficient; values are steady. Planks have again arrived freely; deliveries have been large, and values are fairly steady; stocks are adequate.

British Columbia and Oregon Pine.—Imports, aggregating about

28,000 feet, arrived by the liners; deliveries show improvement, and values are firm; stocks are not too heavy.

S. P. Musson, Son and Company, Barbados, in a trade report under the date of August 1st write as follows:—Lumberstuffs—White Pine.—We note the arrival of Schrs. "Laura" from Bridgewater, and "Ida M. Zinck" from Shelburne during the fortnight, with 291 m. and 120 m. ft. respectively. These cargoes were sold to arrive some time previously at \$33 and \$26, and \$34 and \$27 duty paid for merchantable and second quality, respectively. Market is now fairly well supplied. In spruce—The "Laura" brought a small lot of 20 m. ft., somewhat narrow boards, which were sold to arrive, at a round price of \$21 duty paid. The "Ida M. Zinck" has also brought a small lot of about 40 m. ft., some of which has not yet been put on the market. Pitch pine—The s.s. "Hilding" from Mobile has brought 441 m. ft. contracted for some months previously, which will fill present requirements. Shingles—The Schr. "Victoria" has arrived to our address with 592 m. Long Gaspé, the bulk of which were placed at \$5.75, while we sold a small lot at \$6.02 duty paid. Further receipts are expected. Wood hoops—We note arrival of 450 bdls. from London.

High Quality Lumbermen's Supplies

The building shown herewith represents the home of the Grant-Holden-Graham Company, Limited, of Ottawa, wholesale manufacturers and importers of clothing, men's furnishings, tents, tarpaulins, awnings, lumbermen's and contractors' supplies, etc. This company has started out with the correct idea that the highest attainable quality is essential to the ideal of lightness, neatness and durability. It is their intention to attain this end by paying the highest price and buying only the best selected stock and employing the most skilled labor. They offer goods on their merits, which they believe to be the only way to gain the confidence of the trade.

The published ideals of the company are borne out by the members who compose this firm. Mr. Hugh Grant, railroad contractor, is president. Mr. A. J. Hendry, who has had years of experience and is widely known to the lumbering trade throughout the Ottawa Valley,

Warehouse of the Grant-Holden-Graham Company, Ottawa.

is vice-president. Mr. S. S. Holden, who has been connected with some of the largest manufacturing concerns in America, is general manager. Mr. B. W. Graham, who fills the position as sales manager is well-known to the trade and eastern Canada. Mr. J. S. Grant is secretary-treasurer.

This firm have also a connection in the west with Messrs. Finnie & Murray who take a large proportion of this company's output; also Mr. G. C. Murray will represent the western interest on the directorate. Mr. Hugh Grant, president of the company enjoys the reputation of being one of the most popular railroad contractors in America and is widely known throughout Canada. The rest of the company, as mentioned above, are active members with almost unlimited experience, Mr. Graham, Mr. Hendry and Mr. Holden having been connected with the Woods Limited for several years.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

WANTED TO BUY: One million feet 1-inch Pine Culls and 500,000 feet 1-inch Hardwood Culls. Will take delivery by water or rails. M. Brennen & Sons, Hamilton, Ont. 16-21

Wanted Building Lumber

To sell by active man, middle age, practical experience selling building lumber and hardwoods. Thorough knowledge of credits and collections. Efficient and competent to handle large transactions. Now employed selling in New Jersey and Eastern New York. Want a position offering opportunities for advancement. Address Box 836, Canada Lumberman, Toronto, Ont. 15-16-17-18-19-20

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4 1/2 in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.

1 x 1 x 42.
1 x 1 x 48.
1 x 1 1/2 x 42.
1 x 1 1/2 x 48.
1 x 1 3/4 x 42.
1 x 1 3/4 x 48.

Require Thickness, 1/16-in. Plump.

Quality—Free from all defects.

Can take delivery of green or dry stock.

Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

Wanted to Buy

We are in the market to buy the following lumber:

1 carload 1 1/2-in., 1s and 2s, dry quartered Rock Maple, 5-in. and up wide, 8/16 ft. long.

1 carload Rock Elm.

Also Hickory squares, as follows:

100 gross 26-in. x 1 1/2-in. first growth.
1 car 26-in. x 1 1/2-in. second growth.
1 car 26-in. x 1 5/8 x 1 5/8-in. sec. growth.
5 cars plain white Oak, various dimensions, 6-in. and up wide.

2 cars Rock Maple, various dimensions, 6-in. and up, average 9-in.

Rock Maple logs, 20 to 23-in. diameter at small end.

Rock Maple logs, 24 to 30-in. diameter at small end.

White Ash logs, 10 to 18-in. diameter at small end.

State best prices net cash. Delivery to be made as much as possible this season, balance next. Apply P. O. Box No. 1595, Montreal, Que. 16-t.f.

WANTED—A number of cars of 4/4 Birch and Maple for winter delivery. State price, grades and shipping point. Apply Box 847, Canada Lumberman, Toronto, Ont. 16-19

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Miscellaneous

New Steel Rails for Sale, 25 and 30 lbs. per yard, with fish plates. A bargain for a quick disposal. Imperial Waste & Metal Co., 713 Queen Street, Montreal, P.Q.

Manufactures Wanted by Town

Of Blind River. Situated on the Georgian Bay, eighty miles east of Sault Ste. Marie, Ont. Canadian Pacific Railway runs through center of town and within stone's throw of harbor. Abundance of hardwood, spruce, cedar and hemlock within close proximity.

The town is supplied with abundance of electric power from the plant of Mr. F. Deagle, situated at White Falls, near by, and if necessary a great deal more could be generated.

The town has suitable mill site which it is prepared to lease on easy terms to responsible parties, for manufacturing purposes.

For particulars apply to M. F. DYKE, Town Clerk, or F. Y. W. BRATHWAITE, Secretary Board of Trade, Blind River, Ontario, Canada. 14-15-16-17

Handling Small Circular Saws

About all there is to do to small circular saws, to get results that are pleasant, is to keep the teeth of proper shape and hook, with enough set or swage to give body of saw clearance, and keep the saw sharp, for as sure as you attempt to run the saw too long between filings, you will have trouble, says T. L. in the Woodworker, Indianapolis. Of course, all saws require hammering occasionally. Saws under 24-in. diameter require very little tension. About all they need in hammering is to get the lumps out, but don't make soft and tight places in so doing. To find and remove the lumps it is necessary to give the saw some tension; in other words, you should loosen it up some in the body, then remove all lumps

with a hammer that is almost flat on the face. In the meantime get your tension even throughout saw. When you get it even and well balanced, open up the rim just enough to stiffen the saw, but not enough to cause it to buckle.

Here care must be taken, as most of us know that the rim of a saw expands more than the body, while running, and if you open the rim up too much the saw won't run true. For this one must use his good judgment and give his saw just enough, with a round-faced hammer, evenly proportioned on both sides alike. Around the rim, just below the line of the tooth gullets, the operator must also exercise care in gumming, to keep saw round and the teeth of a uniform size and shape. With the gullets all the same depth, if he has to do his gumming by hand on an ordinary emery grinding stand, it is well to take a pencil, about every other gumming, and mark saw while running at full speed, just below bottom of gullets. A saw kept by hand this way should be jointed with a piece of emery or carborundum at frequent intervals, to keep it perfectly round. Be sure and keep the gullets of the teeth round. Don't by any means file sharp corners in the tooth gullets, as they are almost sure to start cracks.

As to the filing of a rip or re-saw, the front of the tooth should be filed square—exactly square, not beveled either way—while the back will go slightly beveled, for a spring set, but for a swage set it must be square also. I would advise the sawyer who is new at this to get on friendly terms with some good saw-filer and take a few lessons in hammering; also, get some hand-books from saw manufacturers, which can be had, usually, for the asking. These hand-books generally treat the care of saws in much greater detail than any of the boys in the mills can.

The shipments of pulp wood out of Northern Ontario, which are generally low at this season of the year owing to the difficulty in handling due to the absence of snow, amounted in June to 1,071 cords, a very creditable showing. Record pulp wood shipments have also been made to the United States during the past three months, when the value of the wood passing through Cookshire, Quebec, amounted to \$327,169. This is larger than the total shipment of pulp wood through that port during the whole of 1911 or 1912, and there are large quanti-

ties yet to move. Recent rains have swollen the streams so that conditions are decidedly favorable.

New regulations in regard to the development of small water powers in the Dominion forest reserves and parks have been adopted by the Federal Government. These empower the Minister of the Interior to lease water powers which have a development of not over 200 horse power at the low stage of water, the leases to be for ten years, but renewable if the Minister thinks that the power has been continuously and beneficially used.

SALESMAN

WANTED—Lumber Salesman who thoroughly knows, and can sell Lumber in Western Ontario, list of seven to ten million feet. Must be experienced and understand White Pine grading. Give full particulars, experience, salary, etc., in first letter. Box 867, Canada Lumberman, Toronto.

Review of Current Trade Conditions

Ontario

The moderate improvement which was mentioned in our last issue seems to have been maintained and confidence in general conditions seems to have been fairly well re-established.

The box trade still remains very good and this has caused quite a demand for cull hardwoods, elm, ash and birch being particularly scarce. Good grades of elm are also short and there is a strong market for them. 4/4 first and seconds birch are very strong, the demand for these grades being in excess of the supply. Low grades of birch, 2 and 3 common in particular, are being much sought after for flooring factories and a big shortage may be expected, as the factories are not well stocked and the sawmills have no surplus to offer, in fact they are holding a smaller supply than usual. A number of good enquiries have recently been received from the United States for thick birch. Upper grades of basswood seem to be rather quiet at the moment.

There has not been much change in the soft wood market, although some slight improvement has been noticeable in white pine. Hemlock, however, appears to be a little slower. Prices generally have been well maintained.

The shortage of water in the Ottawa River is causing considerable anxiety to local lumbermen. The stream at the foot of the Rideau Canal locks is lower than has been the case for many years.

A number of articles have appeared in the newspapers calling attention to the bush fires raging throughout Ontario. From the lumbermen's standpoint, these have been very much exaggerated. The actual facts being that lumbermen have been kept busy fighting fires which were tributary to their holdings, but the only loss to them has been the expense of fighting the fires and the worry which was naturally caused them. It is, a fact however, that very little lumber has been burned.

Eastern Canada

A decided improvement is reported in the demand for spruce at New York. Wholesalers are finding it much easier to obtain customers for their stocks. The mills however, are offering large stocks and the market is not quite as vigorous as it was a few months ago. Plenty of enquiries are coming forward and it looks as though the yards had come to the conclusion that prices are as low as they can be expected to be. The hardwood situation at New York has also improved, so far as activity in the demand is concerned. Offerings of stock are still plentiful however, so that there is room for improvement. Shipping dry oak is in fair demand, both plain and quartered. Birch is moving slowly, but is expected to improve in a few weeks. Hemlock is easier at New York as a result of the slow July market. The price has eased about 50 c.

The spruce situation at Boston is improving steadily and it is believed that a \$25 basis for dimension orders will soon be established. Random also is stronger, 2 x 3 selling at \$21.50, 2 x 4 at \$22.50, 2 x 6 and 2 x 7 at \$20.50 to \$21 and 2 x 8 at \$22.50 to \$23. These quotations are very pleasing to the wholesalers. Random planned boards are fairly steady at \$23. Stock matched boards 5 in. and up are bringing \$25. Hardwoods at Boston are steady. The Boston market for hemlock is unchanged. A fair amount of orders are being taken for eastern clipped boards at \$23 to \$23.50 and for eastern random at \$22 to \$22.50. Cargo shipments are scarce. Lath are a little more active at Boston, 1 1/8 in. selling at \$4.35 and 1 1/2 in. at \$4, the usual quotations.

Great Britain

Owing to August being a great holiday month in London, markets have been remarkably quiet, the first public sale in that month not taking place until the 20th. However, box and packing case makers report that they have plenty of orders on hand and as trade throughout the country is brisk, it is expected that the lumber market will be very active during the next few weeks. The deliveries at London docks for the week ending August 2 show an increase of about 30 per cent. over the same period last year, the figures being 12,775 standards for 1913, as compared with 9,582 standards for 1912.

Statistics which were recently prepared on the quantity of wood in the various London docks on July 31st last show a very considerable increase when compared with July 31st, 1912. While this is of course very satisfactory, the fact that at this time last year the effects of the big dock strike were still being keenly felt must not be lost sight of.

At Liverpool, as in London, the holiday season has prevented very much business being transacted. There has recently arrived a considerable quantity of spruce deals from New Brunswick and Nova

Scotia. These were however, upon contracts, and owing to the strike in New Brunswick there is very little business being done in contracts for future delivery.

Stocks of spruce deals in Liverpool and Manchester are about 2,000 standards less than was the case in July and this fact together with the increase in freight rates will no doubt strengthen the market.

United States

Trade conditions in the United States during the past fortnight have been moderately steady, but have not shown any important improvement. The situation seems to be one of marking time and waiting to see how business in general will develop during the fall. There is no question however, that business men are looking toward the future with a little more confidence than they were a short time ago. The shaking up which business confidence was given however, will take some time to overcome and there are a number of conflicting situations which must be borne in mind to-day. The two chief factors of this nature are the financial situation and the uncertainty as to the crops.

In the lumber markets of the United States, no important change has occurred of late. The volume of buying continues fairly large, but still the commencement of fall trade seems to be in the future. Retailers apparently are watching carefully for the future tendency of the markets before placing their orders for fall stocks. Railroads are rather backward in buying, but it is generally thought that they will be forced into the market very soon. The demand from the cities continues on a large scale. The northern pine trade is more encouraging than most others. In the Saginaw Valley the market is steady, particularly in the lower grades. Lake Superior and Georgian Bay stocks are finding their way to the Saginaw Valley in fair quantities. Stocks at the Tonawandas are moving a little more freely and there is a suggestion of increased strength at that point. Retailers are expecting a good fall business. The country trade to which the Tonawanda yards cater is dull. The manufacturers are holding their prices firmly.

The hardwood trade in the United States continues to make satisfactory progress. The demand generally is firm, although it is based largely upon current consumption only. Consumers seem to be looking for lower prices, but the indication is that they will have to look a long time. Plain oak is in strong demand and the same is true of quartered oak. Birch, maple and basswood are the leaders in the northern hardwood trade and stocks are only moderate. There is a strong demand for elm for crating purposes. Hemlock continues unchanged. Michigan manufacturers only have about fifty per cent. of their normal stocks. In the Saginaw Valley, boards are firm at \$20 to \$21 and piece stuff is selling at \$19 to \$20. West Virginia mills and Wisconsin manufacturers are both reported to be making slight concessions varying from 50 c. to \$2, but it is thought that these reductions will be withdrawn shortly, as stocks of dry lumber are below the average. Receipts of hemlock at Buffalo, by water, continue steadily. There is an active demand at North Tonawanda both for rail and canal shipments. Boston clipped eastern boards, uppers, are selling at \$23 to \$23.50 and eastern random at \$20 to \$22.50. Eastern buying is reported quite active. The demand for eastern spruce is better than usual at this time of year and mills in general do not seem to be anxious to dispose of their stocks, except at these prices.

A Good Year at Nelson, B. C.

The United States Daily Consular and Trade Reports in a recent issue dealing with the trade conditions at various British Columbia towns, refer as follows to the lumber industry at Nelson, B.C. "The lumber industry on the whole has been a very successful one, although not up to the expectations early in the year. Mills and logging operations were active throughout the year and the production was a considerable increase over that of the preceding year. The demand for lumber from the prairie provinces has been good, but the greater portion has been supplied by American lumbermen, particularly in the cheaper grades. The local demand for building material of all kinds has been good, many buildings of various kinds having been erected in the city and throughout the surrounding country."

Mr. A. C. Hastings, president of the American Pulp & Paper Association, New York, and manager of the Cliff Paper Company, Niagara Falls, has visited Montreal en route to Boston. Mr. Hastings expressed the opinion that the paper market in the United States will considerably improve after September 1st.

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Ottawa Has Many Fires and Low Water

Ottawa, August 22 (Special to the Canada Lumberman): Local lumbermen and manufacturers of forest products generally are much concerned about the low mark at which the water in the Ottawa River now stands. It is already having a rather hindering effect on operations to mills along the river and if it gets much lower may mean that some of the mills will have to shut down for lack of water. Navigation is also being interfered with at some points. At the foot of the Rideau Canal locks the water is at the lowest point it has been for many years and if rain does not come soon it will simply mean that the locks will be put out of commission, and lumber and other freights will have to be taken from the river to the canal basin and vice versa by team.

Bush and forest fires are raging in the vicinity of the Ottawa Valley and a pall of smoke has hung over the city for several days past. Though no valuable timber has yet been burned in the forests near here there are grave fears entertained that the fires may spread and do serious damage if not checked by heavy rains.

Three serious fires have occurred in three local lumber yards this week entailing a total loss of more than \$30,000. All three started from some unknown cause. The first was last Monday night when the planing mill and sash and door factory of W. F. Fraser, on Catherine street, were totally destroyed, entailing a loss of \$15,000, against which there was only \$1,500 insurance. On Tuesday night fire broke out in one of the piles of cull pine in the Mason street yards of the Shepard and Morse Co. and had it not been for the good work of the firemen and the fact that there was hardly a breath of wind blowing a good deal more than \$15,000 worth of lumber might have been burned. About 20 piles of pine was destroyed. There was about \$250,000 worth in the yards. The loss was fully covered by insurance. Last night Richards and Montgomery's carpenters' shop and warehouse were destroyed causing a loss of \$2,000. There is a suspicion that an incendiary is at work around the lumber yards and the police have been asked to investigate.

Lumbermen all over the country will be interested to know that though no official announcement has yet been given out concerning the question of the increase in freight rates on the Intercolonial Railway, it is learned on reliable authority that the questions at issue between the management of the railway and the shippers have been settled. The result is that an increase of about 10 per cent. on all classes of freight will shortly go into effect, but shippers who made contracts under the present rates will have such contracts honored by the I. C. R. In spite of the increase the freight rates on the Intercolonial will still be lower than on any other Canadian railway and in some cases lower than on any road in the world, it is said. Hon. Frank Cochrane, Minister of Railways, who is the logical head of the I. C. R., says that the increase in the rates is made necessary by the great advance during the last few years in the cost of operation and maintenance of the system. Coal for example, he explains, now costs \$400,000 a year more than it did a short time ago while the cost of rolling stock and appliances in general has gone up 25 per cent.

Twenty-two square miles of timber limits will be offered for sale in the Russell Hotel on the afternoon of September 2nd. The limits advertised are in the Temiskaming district and contain pine, cedar, tamarac, birch, spruce and balsam. White and Williams, of Pembroke, are solicitors for the owner.

A case that will no doubt interest lumbermen will come up in the Exchequer Court here on September 2nd when the King versus the Vancouver Lumber Company will be heard. The suit is being brought in an effort to obtain possession of Deadman's Island, a valuable piece of property near the waterfront at Vancouver, B.C., valued at several million dollars and now being sought by two railway companies for use as terminals. The company claim the right to the island under a lease granted them by the former Dominion government. The present government, however, claim that the Order-in-Council granting the lease was not properly signed. Sir Frederick Borden and other ministers who were in the Liberal cabinet will be called as witnesses. Some of the most eminent counsel in the country have been engaged to argue the case for both sides.

The dispute over the freight rates from Fort William to Regina, which has been before the Railway Commission for some time will, as the result of a recent order handed down by H. L. Drayton, Chief Commissioner, be merged with the Western Freight Rates case and come up for hearing shortly. The complaint, which was made by the Regina Board of Trade, was that discrimination in favor of Winnipeg

shippers was shown by the Canadian Pacific and Canadian Northern Railways.

E. B. Eddy, grandson of the late E. B. Eddy, who was the founder of the well-known manufacturing company bearing his name, has made an assignment for \$135,000. The lawyers of the young man in a circular sent to the creditors say that he has no assets at all. When his grandfather died he left him about \$750,000 on condition that he changed his name from Ezra Butler Bessey, to Ezra Butler Eddy. This was done and he at once launched out in a big way as advertising agent with offices in Ottawa, Montreal, Cleveland and Buffalo, but his venture did not prove successful as his assignment proves. The creditors have been asked to wait until 1916 when the young man will receive his heritage.

Montreal News—Trade Quiet but Prices Firm

Montreal, August 22 (Special to the Canada Lumberman): Quietness prevails in almost every section of the lumber trade, but despite this prices are well maintained. Dealers who a few months ago were receiving substantial orders by mail and phone have now to hustle out and seek for business. Although the building permits shows a big increase in value over last year, there is a decided lull in building—not so much in residences, for which there is an increasing demand, but in the large structures, many of the schemes being held up owing to the monetary situation. The lumber trade naturally feels the falling off in building activity, and as collections are by no means satisfactory, the present situation is not particularly rosy. Many lumbermen believe however that things are likely to pick up almost immediately, and that the worst is over.

There is little doing in dimension timber. Many good contracts are pending, and the outlook for a revival is distinctly optimistic.

Lumber is being shipped to Great Britain and the Continent at a fair rate; the exports of pine are normal, while birch is in a little better demand. Unless there is a big rush at the end of the season, shipments will probably be three million feet below those of last year.

Extensive bush fires are reported in the St. Gabriel, P.Q., district. The land is exceedingly dry, and some of the streams have disappeared for the first time for many years.

Quotations in spruce are well maintained, one large mill has been shipping heavily to the United States, and has refused orders for the New York market owing to the cut being entirely sold.

There is little change in the ground wood situation, but it is probable that the continued dry weather will result in a heavy demand in the immediate future, and that the stocks on hand in Canada will be materially reduced.

Sulphite continues a strong market.

Considerable complaints as to the low price of news print are being made in the United States. It is probable, however, that quotations will considerably improve before the end of the year, as the tariff will then be settled, and a disturbing influence eliminated.

Active Building at Tonawanda

North Tonawanda, August 22 (Special to the Canada Lumberman): Twenty lumber carriers bringing upwards of 15,000,000 feet of lumber have arrived at the Tonawandas. Two-thirds of the number have already arrived and been unloaded. When the others are unloaded there will have been deposited on local docks more lumber by several million feet than has been received at the Tonawandas at any previous week this year. White, Gratwick will receive most of this stock. Seven boats are booked to arrive with lumber for the latter company which plans to stock up heavily before navigation closes. Others to receive large cargoes are J. P. Mackenzie, large local dealer in Canadian stock, the Hines Lumber Company and R. T. Jones Lumber Company.

Between the opening of the lake season and August 1, 1913, Duluth and Superior lumber dealers shipped 132,572,000 feet of all kinds of stock to eastern ports on the Great Lakes. Of this total, Duluth handled 131,651,000 feet. This mark is below the record of last year when 146,004,000 feet were sent down from the two chief shipping points of the upper lakes district. During the month of July there was no lumber shipped from Superior and the Duluth handlers of lumber delivered 47,233,000 feet, as compared with 51,279,000 feet during the corresponding period of last year. The falling off is laid to fires that have destroyed three mills operating in the northern Minnesota and Wisconsin districts.

The plant of the Tonawanda Advertising Company was destroyed

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

OF DRY SPRUCE IN CANADA

by fire early in the week. The plant was a large user of lumber which it manufactured into wood advertising novelties. The loss was \$100,000. A dry kiln with half a million feet of lumber in it was saved. The plant will be rebuilt at once. The fire was the second in a year.

Building continues brisk, particularly in North Tonawanda where one section of the city alone will see forty new houses as fast as they can be built. Dr. Duncan Sinclair and James Sinclair, the latter a resident of Toronto, Ont., until recently, have just completed twenty new houses and they say they will spend \$200,000 on forty more as fast as they can be erected.

Mr. William H. Griffin, a prominent lumberman, has just been re-elected to a three-year term as a member of the North Tonawanda Board of Education.

F. Reddaway & Company, manufacturers of the well-known "Camel" brand belting, have appointed the A. R. Williams Machinery Company, Limited, of Toronto, Winnipeg and Vancouver, as their selling agents and they will carry full stocks of "Camel Hair" belting in these cities.

Railroad Cartage Service to be Discontinued

Manufacturers in all parts of Canada are vitally interested in the announcement that Canadian railways have cancelled their cartage services hitherto afforded. The matter will be taken to the Railway Commission shortly. Word was sent out by the Canadian Freight Association that the service has been discontinued, the notice reading that "they would issue cancellation notice to their cartage tariffs to become effective October 1st, 1913. On and after October 1st shippers and consignees must make their own cartage arrangements. The railways give ninety days' notice to the public, thus affording them ample time to make their arrangements for carting." The order affects every distributing point in Ontario and Quebec as well as Ottawa. It means that the Canadian shippers will have to get private companies to do their carting for them, whereas the railways have now their own companies. They threatened to take this action when the Railway Commission some months ago would allow them to increase their charges only 10 cents instead of from 40 to 60 cents as they wished, stating that the service would no longer pay them unless they could make the desired increase.

The Round Saw

By Hapsburg Liebe

AN EXPERT'S VIEWS ON HOW TO HANDLE IT

The small mill of the "groundhog" type; the mill with the portable frame, carriage, engine and boiler; the mill of the rotary saw—that is the mill I am writing about, and it is a subject that has had all too little notice by a world to whom it has given so much. I shall, of course, confine my little dissertation to difficulties.

Insufficient Power

Far from being the least in importance in the list of troubles that prevail among the operators of the little mill with the big saw, is insufficient power. This is a drawback that is very common, and it reaches deeper beneath the surface than those who do not understand would at first blush believe. Suppose it is a 60-inch saw, and that it has been opened up in the centre suitably for a speed of 600 revolutions per minute—which, although a hypothetical figure, is not far from being the correct speed for a saw of that size. If the steam lags, or if the engine is too weak even with an abundance of steam, the speed of the saw falls down easily to 400 r.p.m. Clearly, the saw is tensioned too highly for 400 revolutions—and to prove that it is, it will do just about anything else but the right thing. And this happens most frequently with big timber, therefore, the saw is up against its hardest work when it is least fit for it. Result, miscut lumber from the finest of the timber. A few other troubles arise in the shape of a discouraged sawyer, an overworked fireman, and strained machinery. Verily, if more of the little-mill owners would begin their plants with the installation of an engine and boiler which would give enough power under the worst circumstances, there would be much more satisfaction among them. One can ill afford to make miscuts in this day of high-priced timber. There is always fuel in abundance for the bigger boiler; the expense comes only in the first cost, and it is the best economy in the world to spend a little more money here.

A minute ago I mentioned the fact that a saw hammered for one speed is not adapted to another. I remember a case which I will here use by way of an illustration.

The mill at which this occurred use a 60-inch inserted-tooth saw, which they had been accustomed to run at a low speed—about 400, if my memory serves me right. The saw had been to one of the best saw shops for a thorough going over with the hammer, and the mill owner, in sending the saw, had made no statement concerning the speed at which it was being run. In due time it was returned, put on the mandril, and started at the old rate of speed. It ran almost every way but straight—principally, however, out of the log. The mill owner was about to return it to the shop when the sawyer decided to try a high-speed. The revolutions of the engine were increased until the saw ran 625 r.p.m., and all difficulty was over. When one is not certain of his ground, let him try a different rate of speed; there are many times when it will eliminate one's trouble.

Heating

In a great many cases, the round log saw that snakes and makes miscut lumber thereby is hot, either at the rim, or in the centre, or all over. If it wasn't hot when it started snaking, it soon becomes hot because of the friction caused by its not running straight. If it gets hot before the snaking begins, to remove the cause of the heating is, of course, the proper thing to do. The backs of the teeth being too high, and therefore exposed to friction behind the point, will cause the saw to heat on the rim—and injudicious or careless filing is

the cause of the teeth being too high on the back. If the teeth have been filed too hard to the log, the leading in of the saw will cause it to heat by friction against the logside guidepin; and the saw having too much lead toward the log, even with the teeth square, will bring about the same undesirable condition. Also if the guidepins are set too tightly, there may be heating on the rim. Too few teeth for the work in hand may cause the saw to heat, by reason of there being too much sawdust for the throats to chamber, thus allowing it to spill into the spaces between the saw and the sides of the cut, and produce heating; also heating may be brought about by an accumulation of gummy sawdust on the body of the saw. Lumps, of course, will produce friction. And the mandril running warm in the bearing nearest the saw is one of the chief causes of the saw's heating in the centre. Keep that bearing cool if you have to resort to the practice of running a small stream of water on it.

Of course, under certain circumstances—they are never the right circumstances, but "Needs must when the devil drives"—running the saw warm is of benefit. If it is too open in the centre, too highly tensioned for the speed permitted by an old and unsteady mill, to run it warm on the rim expands that portion of it and makes it less open in the centre. On the other hand, if the saw is too stiff in the centre, to run it warm in the centre will expand that part, and give it more tension. Adjustments of this kind, however, are somewhat uncertain, and better remedies are to be recommended when it is possible to get them.

Lead

The matter of lead in the rotary log saw is all important. It is indispensable to the best practice, although it may seem somewhat contrary from a purely mechanical standpoint. I have heard it argued that the saw may be dishd to the log—either by the hammer, or by the collars, or by putting a pasteboard washer between the outer collar and the saw—instead of obtaining the lead by turning the mandril slightly out of square with the track; but this method of obtaining lead has at least one serious drawback; the upcoming teeth on the back side of the saw will keep the air full of sawdust and mark the boards badly. Of course the logside of the saw should be straight, at least, I'll admit that right here; because the saw is usually a gauge thicker at the eye than at the rim, and because the board can spring from the saw and the log cannot. Is it clear?

But ever so little lead is sufficient under the average circumstances. One must be guided in the amount of lead, of course, by the conditions that prevail in his mill. A little judicious experimenting will show up the degree that is best.

Fitting the Saw

As a general thing, economy in the price paid for the hammering of the rotary log saw is the most expensive economy in the world. Every man who happens around to your little plant with gauges and hammers and wants to bench your saw on a blacksmith's anvil can't give you a good job—even if his moderate charge is tempting. And then, where is his guarantee? The shops give a guarantee, and one may usually count on getting a good job; so it is best to pay their prices and the freight, rather than entrust the work to someone of whose skill as a hammerer you are not at all sure.

along in a rut, so to speak. Many of us are doing just as our sawmilling fathers did in the days when there was an abundance of timber and the facilities for its manufacture were much less. The sawyer has one saw, and one saw only. He comes to the mill half an hour early in the mornings, and sharpens that saw—swages it, perhaps, perhaps puts in new teeth, according to what he finds necessary. He stops for half an hour in the middle of the forenoon. Always on one saw. Why not, I ask you, have two saws instead of one? An extra hour for the sawyer to work each day? Yes, but—pay him for the extra hour, and save the pay of a dozen men, and the expense of having one-tenth of the day lost and gone to blazes. And then—it isn't at all conjecture, but knowledge gained from actual experience—steel is the better for having rested. The little molecules, strained out of their natural positions, settle back into their natural and rightful places in the body of the saw while they are cool.

It is done every day, thousands of times, perhaps; but a great many of the best authorities forbid the use of the jumper swage, or upset, on inserted points while they are in position in the saw. Continual pounding is bound eventually to open the socket, or twist it out of line with the body of the saw—it may not be in evidence at first; but it will come. Hammer the socket back into shape? There are some who can do it; there are more who cannot. Besides, the necessity of such a measure may be easily avoided. I have seen the points swaged while being held in a vise; and I have seen them swaged while being held in a bit of sawplate having in it a socket for that one purpose.

In filing the teeth, one cannot be too careful to keep from filing too low on the points, thus causing the backs to rub when the teeth become a trifle dull. The majority of inserted teeth are made with high backs in order that there may be plenty of hook, and a mere brushing with the file is usually enough for these backs. And one should be careful that he doesn't file a sharp corner in the tooth under the point; it is a check to the free shedding of dust, and causes the dust to filter out into the cut, sometimes causing heat from friction. Under ordinary circumstances, there is little necessity to file the saw to the log for lead; but it does no harm to file from the boardside in order that if there is any lead made by the filing it will be toward the log. Observe the original degree of hook as the teeth are filed back; but do not get them too thin on the point, or the corners will break and crumble away. For smooth lumber, use a gauge, and bring every corner to it with a common mill file.

When the holders of the inserted-tooth saw become worn and

fit in their sockets loosely, they may be stretched by hammering, and made to fit with their original closeness. Hammering on the inside of the circle, of course, makes the ends fit tighter and loosens the middle, and vice versa; but hammering on both sides of the circle will, with care and frequent testing, give the results desired.

While the average sawyer may not be able to give his saw a thorough hammering, there are instances when a few blows, if given in the correct way and in the right place, may be of great advantage. Take, let us say, the blue spot. The blue spot is, of course, on the side of the saw opposite the lump that made it. The lump itself is worn bright from much rubbing; and the heating by friction is what caused the bluing on the opposite side—except in certain cases, where the stain of the timbersap colors the surface that is below the level, and as continued heating has a strong tendency to permanently expand metal, let me advise the earliest possible treatment of the blue spot. Hammer it down, of course; but not by the ordinary method of hammering on a naked anvil; put a piece of leather or pasteboard on the anvil, so that the hammering will not stretch the plate more and thereby aggravate instead of help the trouble. Also in the case of bending the edge of the plate at some point between sockets, an occurrence which comes only with accident, the sawyer may help himself. But the saw should be warmed at the point of injury, especially in cold weather, to prevent breaking. And if the twisting is very acute, it may break anyway; so in that instance it is better to send the saw to the shop.

General Suggestions

Be sure that there is no spring in the frame of the mill. This is a thing that causes a great deal of devilment, sometimes. For instance, the saw may be running perfectly true, with the correct amount of lead and all, when there is no load on; then when the saw enters the cut and the load comes the mill gives, and throws the saw badly out in its relation to the track.

Be sure that there is no lost motion in the mandril bearings; that the bearings are firmly bolted to the frame; that the bearings have plenty of good, heavy oil, and that the oilholes are kept covered to prevent foreign matter getting into them. In babbitting these bearings, use a number of thin liners, so that the wear may be taken up gradually—which, of course, is the way the wear comes.

Use water on the saw to remove accumulations of gummy sawdust. Keep accumulations of sawdust from the V-rail, or guiderail, of the track. Do not allow the guiding wheels of the carriage to become clogged with dust.

Profit Making for the Retailer

By E. A. Laughlin

Profit is the will-o'-the-wisp of the business world. I know of no secret that will change inertia into gold, I know of no panacea other than work, the work of trained brain and brawn in the creating of profits in any line of effort.

I shall consider this a very profitable article if readers will warm up to the subject and send in their views on this topic of profit-making. It is not necessary to talk price or the maintenance of price, although price is an important element of profit-making.

When I say building material I mean substantially every kind of material that goes into construction work. The alert up-to-date lumber merchant cannot afford to circumscribe his opportunities. He should handle everything in building material; he should sell brick, rock, crushed stone, gravel, cement, lime, plaster, paints, lath, builders' hardware, corrugated iron, structural steel, wire fencing, cut stone, marble, mosaic, wood preservatives, prepared roofing, composition boards, such as beaver board, coil board and plaster boards, commercial fertilizers, silos and silo material, all of which are within the realm of lumber merchandising, some of which offer a far greater per cent. of profit than can be realized from lumber.

Some will say it is impossible to handle such a variety, because of the large stock necessary to carry a large stock. Frequently by being conversant with the value and usage of most of these items, it is possible to make sales without keeping the items in stock. The small amount of stock necessary to carry, together with the several cleanups that you can make each year on most of these items, makes the diversified business of selling everything in building material a very profitable business.

The changing conditions, the competition from many outside sources, should quicken every retailer of lumber to develop a more diversified business. The handling of everything in building material will prove a factor of production. With a variety of such materials you are in a position to get trade that would otherwise drift to non-resident and local live wires who see fit to handle a variety of goods in order to draw trade. The goods that go fast are the profitable lines,

and most of the items mentioned can be turned over several times a year, at a small extra cost, with little overhead expense.

The sale of lath should mean the sale of plaster, lath nails and water colors to tint the walls. The sale of fence posts should permit of the sale of fence wire, staples and possibly fence gates and wood preservatives in the way of creosote oils. It pays to explain the possibilities of these things, for instance, as a disinfectant, the painting of chicken houses, hog pens and many other things about the home and farm, that creosote oils are good for. The sale of crushed rock should mean the sale of cement and sand, and frequently the lumber for concrete forms, with the necessary nails and such. The sale of lumber for a shed should mean the sale of the composition roof to cover it, and the nails to put it together, and paint to paint it. The sale of plaster board should mean the sale of the mouldings and strips to cover the joints, the paint and the tints to decorate the wall board, screen doors, screen windows and screen wire, together with the necessary hardware, all items which mean profit to the retailing of building material. The sale of lumber to make window frames should mean the sale of mouldings, windows, the sash locks, pulleys, weights and cord, all of which means added profit to the dealer. Take the sale of commercial fertilizers, of which there are several kinds, there is no reason why the dealer of building material should not familiarize himself with this, as it gives him the first chance to get in close touch with the farmer and the truck gardener, and often leads on to many sales of the other items the dealer otherwise would not get. Suggestion is an important factor in creating new business. You can make many sales by suggestion.

Importance of Silo Material

Silo material is an important adjunct in retailing building material. Every lumber dealer in the country should familiarize himself with silos and their hundredfold advantages to the farmer, to the community, and to the dealer who sells them. There are very few modern improvements that will show greater measure of profit to the farmer, to the community, and to the dealer than good silos.

Management of an Up-to-date Camp

Practical Suggestions by a Man of Experience on How to Get
Out of a Logging Operation at a Profit

Sturgeon Falls, Ont., August 16th, 1913.

Editor Canada Lumberman, Toronto:

Dear Sir,—Having had fourteen years actual experience in the lumber camps, and, in that time, having held every position available in connection with the woods operation from the road cutter to the walking boss, and with the additional experience of one year on the Ontario Government staff of forest rangers, in which capacity I have had the opportunity to be through some of the most successful and up-to-date lumber companies' camps, I now submit through your paper, for the benefit of those who are interested in the lumber trade, my view of an up-to-date logging camp, which has been obtained from minute study of every branch of the woods operation.

A great many of our lumbermen to-day still follow the old way of logging and never give a thought to the more modern ways or to the advanced methods that are being introduced each year. Many firms have had to go out of business or go bankrupt owing to the enormous cost of logging and drying of late years. The advance in the cost of logging at the present time is of course due mainly to the advance in wages, and the price of provisions and horse feed. This, together with the incompetent laborers available for woods operations to-day constitutes the difference in cost between past and present logging, but, if the latest and most up-to-date methods are applied to-day, logging can be done in the woods for little more than it cost when labor and food-stuff were at a much lower figure.

To get the best results from a logging camp to-day a firm must have all the best and latest appliances obtainable to work with, and if this is done and particular attention paid to the woods operation by competent men, logging will cost but very little more than it did ten or fifteen years ago.

The days of spike skids are gone, the block and line jammers and other loading devices, having taken their place. These latest devices for loading, with the patent plow, snow roller, and up-to-date sprinklers for making roads, if properly run, all tend to reduce the cost of logging.

Some companies have introduced the steam log hauler and steam skidders, but only in certain places can such machines be operated to any advantage. Through northern Ontario where the country is broken and where lakes and rivers play a large part in the hauling programme, such machines cannot be worked to any advantage. There is no doubt that if the steam log hauler or skidder had been in existence when some parts of old Ontario were being logged they would have been a success, for, in any kind of level country where water is scarce, these two machines, worked together, could be made a paying proposition.

Proper Size of a Camp

In my opinion a logging camp should not contain over one hundred men, including all. This is quite enough for a foreman to manage and do it properly, and it is also quite enough to have in one sleep or bunk house. A bunk house should have at least twenty-five square feet of floor space to each individual. Thus, if you have ninety men in a bunk house it should be equal to fifty-five by forty feet in dimension. Bunks should be raised one foot from the floor and there should be lots of ventilation, a good clean bunk house is a large factor in keeping good men. If lumber companies would pay a little more attention to the accommodation of the men, shantying would not be held as the lowest kind of labor, as it is at present, and a better class of men would be obtained for the lumber woods. Care should be exercised in the building of stables and out houses to have them situated so that their drainage will run away from where water is obtained for the cookery or for the men. Care should also be shown in the selection of the place where the refuse from the cookery is thrown. A good suggestion is to have a large pit dug and a cover put over it, to keep the snow out.

In the spring the refuse can be burnt or buried. This also enables the foreman to watch and see that no unnecessary waste is being made in the cooking.

Every camp should have a laundry or a wash woman and this can easily be arranged if the men are charged fifty or sixty cents a month, in favor of the party undertaking to do the washing. There is many a woman who would be only too glad to get into the camp with her husband, who can work in the woods while she can do the washing. This is practically a necessity in every camp and every up-to-date camp will have it, as it helps to keep the camp clean and prevents sickness and disease which are often the result of filth and neglect on the victim's part. It also helps to keep good men in the camp, for few men in these days will remain in a camp which is lacking in cleanliness or is without a laundry.

Main Road Cutting

To get the best results out of a gang of main road cutters, every foreman should have a competent buck beaver, or head main road cutter, for in these days, when all classes of men with all kinds of trades, are liable to be found in the camp, this work requires a man of push, and also with a practical or at least a fair experience of handling men and cutting or fixing main roads. Such a man can always be found for an additional few dollars per month above the average wages.

The only possible way of obtaining anything like fair work out of men to-day is for the foreman to be with them continually while at work. To do this, they must all be in small bounds or as close together as it is possible to have them, which can be done by having the logmakers all on one road. Thus, if you have six gangs of cutters, you can have three on each side of the road and the skidders in two gangs, each composed of three rollers, with sufficient teams and trail-cutters to follow three gangs of cutters. The skidways are to be built by a gang for the purpose and the location of each must be laid out by the foreman. In placing men in this manner a foreman has them under his continual observation and personal supervision, calling them to lunch and starting them from the fire after lunch again. The gangs should all eat together in the same place, when lunch should be brought out hot, when convenient. At quitting time the foreman should call all home at the same time. In my opinion this is the only way to keep the incompetent lumber Jack of to-day at work and I am sure if this method were followed, better results would be secured from any gang of men.

Road making can not be started too early, as soon as there is sufficient snow the roller should be run over the roads. This levels up the bottom and is a great benefit when breaking the roads later.

In loading, some men prefer the block and line to jammers, but in my opinion one or two jammers can be successfully operated in any camp for, with fair trial, they will handle more logs, with less exertion on the loaders' than any block and line in the same time, and besides, it requires but one competent loader to work them, where the block and line requires three competent loaders to do any kind of fair work.

Where small timber or pulp is being handled, a good idea is to have collapsible stakes in the bunks and load with a crotch line. This will do more than any ordinary line, and is one of the fastest methods for handling small logs or pulp wood.

Space will not permit me to enter into the subject further just now, but later I will contribute a letter on the latest and most up-to-date methods of river driving and hiring men,

Yours truly,

Edgerton Martin.

TO INSURE SATISFACTION—STATE WHERE BELT IS TO RUN

Elmira Wood Split Pulleys

THE efficiency of your factory often is a question of transmission efficiency. Good belting and the best pulleys are essential. For three years we have been making Elmira Wood Split Pulleys. They are substantially put together and only thoroughly seasoned wood is used in their manufacture.

Send for our illustrated catalogue.

EDGINGS

Ontario

The Brockville Lumber Company, Limited, recently increased their capital from \$75,000 to \$200,000.

The planing mill owned by Mr. W. F. Fraser at Ottawa was completely destroyed by fire recently.

The planing mill of Mr. O. C. Teal, of Bridgeburg, Ont., was completely gutted by fire on August 20th. The damage is estimated to be about \$20,000.

The tax-payers of Hawkesbury, Ont., have passed a by-law agreeing to give concessions to a proposed company which will erect a paper and board mill.

R. H. Campbell, chief forester of the Forestry Branch of the Department of the Interior, is making a tour of the west in the interests of his department.

A contract has been awarded to Benson & Bray, Limited, Midland, Ont., for sashes, doors, etc., amounting to \$7,000, for C. P. R. buildings on Ontario division.

E. Stewart, managing director of Canada Timber Lands, Limited, Toronto, spent some time in Vancouver, recently. Mr. Stewart was formerly Dominion forester.

Forest fires have been raging for some time in the neighborhood of Pigeon and Bold Lakes, Ont., and these fires have caused a great deal of damage; some of them are said to have been started by tourists.

The Bay of Quinte Wood Company, Limited, was recently incorporated with a capital of \$500,000, with head office at Toronto. The company will manufacture and deal generally in timber, lumber and wood of all kinds.

A new company is being formed to erect a paper and board mill at Hawkesbury, Ont. Mr. Helmick, of Montreal, is one of the gentlemen interested in this company and it is understood that a prospectus will be issued shortly.

There are number of fires at the present time in the Parry Sound district and considerable damage has been done to standing timber, wood and tan bark. A large number of railway ties are also reported to have been destroyed and also several settlers' houses.

A fire, the origin of which is unknown, completely destroyed the lumber yard of Chew Bros., at Midland, Ont., on August 18th. The quantity of lumber in the yard was about 15,000,000 feet and the loss is estimated at \$250,000. Unfortunately at the time the fire occurred the yard was very full as Messrs. Chew Bros. were cutting lumber for a number of mills.

J. R. Booth, of Ottawa, intends cutting thousands more logs in the woods next winter than he did last. He will shortly have 20 camps operating in which will be 2,500 men, 1,000 more than last season. The camps will be located along the Black, Coulogne and Montreal Rivers. Shepard & Morse and several other local firms also are going to make a bigger cut this year than they have for some time. There is no dearth of men offering themselves for work; in fact, men have not been so plentiful for a long time.

Eastern Canada

The sash and door factory of Mr. R. F. Hogan, of Charlottetown, P.E.I., was recently destroyed by fire.

The lumber and sash factory of F. Tremblay & Company at Montreal was partially damaged by fire. The loss is covered by insurance.

Scierie Mont Laurier, Limited, have been incorporated with capital stock of \$49,000. W. Lalonde, Montreal, P.Q., is advocate for the company.

The Seaman Kent Company, 970 Durocher St., Montreal, P.Q., have had plans prepared for the erection of a lumber warehouse, to cost \$25,000.

The sawmill belonging to The McLaren Company, Bout De L'Isle, Que., was recently destroyed by fire. The loss amounted to \$50,000. The company will rebuild.

The sash and door factory belonging to Ferland Bros., at L'Epiphanie, P.Q., was destroyed by fire recently. The loss amounts to about \$25,000. Owners will rebuild.

Mr. H. T. Meldrum, secretary of the Montreal branch of the Canadian Manufacturers' Association, has been offered the position of secretary-treasurer of the Canadian Pulp and Paper Association, Montreal. It is understood that Mr. Meldrum will accept the position, and at the same time retain his present appointment.

A large number of citizens of the Eastern Townships of the Province of Quebec have petitioned the Hon. Jules Allard, Minister of Crown Lands, asking that the Government build storage reservoirs to hold the waters of the St. Francis River in order to regulate the flow. They also ask that the Commission on Running Waters study the problem.

A considerable portion of the sash and door factory of F. Tremblay and Company, William Street, Montreal, has been destroyed by fire. The firm is one of the oldest in the city, and the building was by no means of a modern character. A carriage factory adjoining the property of F. N. Tremblay & Company, was also burned, the total damage being about \$25,000.

By the end of the month the E. B. Eddy Company, of Hull, will have its new pulp mill in operation as well as its new power house completed. This mill, which is said to be one of the largest and most up-to-date in the world, will mean a considerable increase in the output of pulp. The opening of the new power house will enable every other branch of the plant to handle and manufacture material much more expeditiously than is the case at present.

Mr. William Price, of Quebec, has been appointed hon.-president of the Union Bank of Canada, in succession to the Hon. John Sharples. The vice-presidency vacated by Mr. Price has been filled by the appointment of Mr. George H. Thompson, Quebec. At a meeting of the directors in London, England, at which these appointments were made, a resolution was passed ex-

pressing regret at the death of the Hon. J. Sharples, for many years president, and latterly hon.-president of the bank.

The feature of the market in Montreal is still the increasing demand from American mills for Canadian ground pulp. It is quite evident that the present low water has seriously curtailed the production of the mills in the eastern portion of the United States, thus throwing manufacturers back on the long-accumulating stock of the Canadian mills. News print and sulphite are still in such demand as to keep all the plants in the Province working at capacity.

Mr. David Gillies, one of the leading lumbermen of Hull, Que., recently received a rather amusing letter from one of his fire rangers on the upper Ottawa River in which the old ranger compares bears with mice and squirrels. The letter reads in part as follows: "Bears are a little troublesome this month. They have broken into the hut at Catfish several times lately and have eaten my provisions and upset everything in the place. I had the window nailed up with inch boards and five inch spikes, but this protection was torn off and the bears got in again. They even come at night and waken me when I am sleeping. One night I struck one big fellow in the face just as he was climbing through the window and I scared another away when it started to pull down the barricade around the hut. The park keepers tell me I should get a revolver, but I am not afraid of bears, though I confess they are a little more troublesome than mice or squirrels."

Western Canada

The planing mill of the Crows Nest Lumber Company, Wardner, B.C., was recently destroyed by fire, the loss amounting to \$40,000.

Jas. D. McCormack, secretary of the Canadian Western Lumber Company, of Vancouver, B.C., spent some time early last month looking over Prairie conditions.

Brayton & Lawbaugh, Limited, were recently incorporated at Vancouver with a capital of \$25,000. The objects of the company are to operate in timberlands.

The mill of the Standard Lumber Company of Cranbrook, B.C., was completely destroyed by fire recently. The lumber in the yard however, was saved, but all the equipment, tools and lumber which was in the mill was a total loss.

The amended Dominion Forest Reserves and Parks Act has added over 10,500 square miles to the existing area of Dominion Forest Reserves. This makes a total of over 35,000 square miles of reserved forest land in the Western provinces under Dominion jurisdiction.

Mr. George Cushing, of the firm of Cushing Brothers, Limited, one of whose planing mills is located at Saskatoon, has sold out his interests in the big concern at an ample figure not yet made public. It is understood that Mr. Cushing intends to enter upon some other line of business.

Messrs. Clark & Lyford, Limited, were recently incorporated at Vancouver with a capital of \$20,000 to carry on the business of forest engineers and timber cruisers and valuers. This business had previously been carried on for a considerable time under the style of Clark and Lyford.

The plant of the Pacific Woods Company on Burrard Inlet has been bought by the Howe Sound Mill & Logging Company, representing Messrs. Newberry, Roray and Lewis, of the State of Washington. Mr. Roray will have charge of the manufacturing end, while Mr. Newberry will superintend the firm's logging operations on Howe Sound.

Two Dominion Government survey parties are working the railway belt in British Columbia this summer, the intention being to segregate the remaining non-agricultural lands in to forest reserves as rapidly as possible. This will be done in order that the forests may be more efficiently protected from fire and that, administered by technical foresters, their greatest utility and productiveness may be secured.

The Western Canada Paper Company, which has a daily output of 20 tons of building paper and 15 tons of wrapping, at Sapperton, on the Fraser River, has for its officers this year: President, Barclay Bonthron, Vancouver; vice-president, A. E. White, Vancouver; directors, E. F. Allen, Joseph Caldwell and A. S. Brake, Vancouver. C. J. Bastedo, who was formerly with the Canada Paper Company, of Windsor Mills, Que., and the J. R. Booth Company, Ottawa, is general manager, the superintendent being C. S. Shandley, who for ten years previous to coming to the Coast was with the E. B. Eddy Company, of Hull, Que.

Notwithstanding the improvement in general business conditions in Manitoba, owing to the excellent crop outlook, the lumber business has not picked up to any great extent yet. The financial stringency has been apparently a big drawback to the trade, and retail dealers throughout the country are ordering conservatively, although their stocks are comparatively small. The scarcity of money prevents the launching of enterprises, and in most districts in the prairie country the farmers have been prevented from doing much building for the same reason. A better movement of lumber and builders' supplies generally is expected in the fall.

Will Handle Freight Difficulties

Mr. U. E. Germain, of 423 Coristine Building, Montreal, P.Q., is organizing a lumberman's tariff bureau and a freight claim and audit department. The main object is to compile and publish a Freight Rate Book containing lumber rates from all producing Canadian points to all consuming Canadian points, also to United States points, to which Canadian lumber is exported, and from producing American points to consuming Canadian points. The proposed freight claim and audit department, which will be separately managed, will file claims for overcharges of all kinds, excess weights, rates, wrong routing and demurrage, and will audit all freight receipts of subscribers. A table of weights of all descriptions of lumber will be prepared, from data to be furnished by manufacturers.

Stop the Leaks

Every leak you stop in your business means larger profits. It will pay you to read our new belting book. It is full of useful suggestions that will help you get more efficiency out of your varied kinds of belt drives. It may save you hundreds of dollars by increased efficiency in your methods of transmitting power.

Write today for free copy of this useful book—
The Main Drive.

Use Scandinavia

This is the original solid woven belt. It is without plies, cannot come apart and runs evenly and true, transmitting the maximum power. It is adapted for both main and direct drives, straight or crossed. Scandinavia is enormously strong and durable. It will save you money.

Federal Engineering Company, Limited TORONTO, MONTREAL

GOODHUE BELTING

For

Saw and Planing Mills

In a Goodhue Belt you get only the best leather with the stretch taken out of it. A Goodhue Belt will always run evenly and "clings" to the pulley transmitting 100% of your power.

For the wet places in the mill we have a special waterproof leather belt—"Acme." Other Goodhue Belts are "Extra" and "Standard" recommended according to the conditions under which the belt has to run.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent.

by using our
**Patent Steel Band
Mill and Carriage**

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa,

Deputy Minister.

December 20th, 1912.

Maximum Value at Minimum Price

The Shimer Limited, with Expansion, Fig. 628. Groove Head with 8 Bits and self-centering and spindle clamping features. Price \$36.23 each, complete.

The Shimer Limited in solid section, Fig. 625. Groove Head with 8 Bits and the self-centering and spindle clamping features. Price \$33.50 each, complete.

Fig. 203, Popular Expansion Groove Head with 4 bit seats, complete, net \$20.48. Made also with 6 and 8 Bits to each Head.

The Shimer Cutter Head meets the demand for tools containing all the proved practical improvements of the day, yet selling at a price that has not been made exorbitant because of these improvements.

They are a necessity in every mill if the best work in paying quantities is desired. They are economical, reliable and profitable to use and make your product your best advertisement.

Their service is constant, accurate and dependable under all conditions. Mechanical injury to Shimer Cutter Heads is practically impossible on account of design, materials used and general sturdy construction. To make utterly certain the strength of these tools we manufacture our own Solid Steel Forgings from selected metal of 60,000 lbs. tensile strength.

Shimer Cutter Heads protect you from many of the troubles which come up daily in the mill, because they are based on scientific principles properly applied by those who have made the study of Cutter Heads a life work.

If you want to get the best results from your matcher and moulder you should equip them with the Shimer Cutter Heads. If its a question of getting the "most for your money"—of "efficiency, long service and economy"—you will eventually buy these tools and *you will be satisfied with your purchase.*

Let us demonstrate their worth to you. Let us show you in your own mill the advantages of these tools.

WE SEND THE HEADS ON 30 DAYS' FREE TRIAL SO THERE IS NO RISK FOR YOU TO RUN. SEND ORDER TO-DAY.

SAMUEL J. SHIMER & SONS, Galt, Ont., Can.

MODEL 5 AMERICAN NUMBER 77

Unexcelled, We Say

For Quality of work turned out
For Material, design and workmanship
For Rapidity of feed
For Ease and convenience of adjustment

Unequalled, Users Say,—

The term is no doubt more nearly correct.
Their judgment is better than ours, for their success is in its superiority—so they testify.

Have You a 77?

If not, look up the Model 5.
Don't take a substitute
or an imitation—
there are
many.

The Improved **FAY-EGAN "LIGHTNING"** No. 171 Matcher and Medium Sizer has all the time saving and money making advantages of the latest Fast Feed Matchers—Here are a few—

CAPACITY.

Made in two sizes, 20 in. and 30 in. wide, each size working up to 14 in. thick.

Feed-in rolls made in two sections on 30-inch machine to permit feeding two pieces of uneven thickness at one time. Rates of feed arranged to suit individual needs.

VERSATILITY.

The No. 171 will give equal satisfaction on light matching, running flooring or heavy timber sizing. In addition the pressure bars are so arranged as to permit the use of overswinging cutters for making moldings up to one inch deep.

CYLINDERS

Cylinders are double belted, each driven direct from the countershaft. This is the

wonderfully successful "333" cylinder drive without frictions, imparting more power to the cylinders with less belt wear than any other method. Either square-forged steel cylinders or our patented circular heads with thin air-hardened "Tungsten" steel knives are furnished. With the latter we can furnish setting, jointing and grinding attachments. Lower cylinder draws out at side of machine to facilitate setting or sharpening.

MATCHER SPINDLES

The matcher spindles are extra heavy and mounted in self-oiling bearings. We can furnish circular heads and jointing attachment for sizing if wanted.

GRAVITY TIGHTENERS

All belts have gravity tighteners, increasing the pressure as the load increases, pre-

venting slipping with loss of power and burning of belts. When machine is not in use the tighteners are thrown back, leaving the belts hang slack, giving much longer life to the belts.

FEED

Six large rolls, double geared, all gears cut from the solid, the main driving gears entirely cased and running in grease gives a powerful and almost noiseless drive. A steel roller chain carries power to out-feed rolls. Fay-Egan Matchers are the only ones on which no cast iron gears are used. Every gear is cut from the solid, the perfect mesh greatly reducing power consumption.

ADJUSTMENTS

All adjustments are conveniently arranged and the feed is controlled at in-feed end and side heads.

Make MORE MONEY Selling Roofing

You can't make your roofing department pay big money as long as you continue to sell the same kind of roofing as your competitors—especially when prices are being cut right and left.

Make your roofing sales worth while—and control the bulk of the roofing business in your locality, regardless of price, by selling

J-M ASBESTOS ROOFING

This roofing puts you absolutely above competition. It is different from all others—in a class by itself—

BECAUSE—It is made of Asbestos Rock Fibres and Trinidad Asphalt. It is all mineral—therefore practically indestructible. It affords perfect protection against fire. It never requires coating. It sells more readily than any other roofing. Every user recommends it to his friends.

REMEMBER, we make only **one dealer** for this roofing in each town. The first dealer to take advantage of our proposition places himself in a position to practically monopolize the roofing business in his territory.

Don't delay. Write today for Special Dealer Proposition.

Steam Press

THE American steam press is carefully designed and substantially built of steel. It is used for baling shavings, asbestos and many other materials.

The cylinder is 30" diameter by 45" high and the pressure maintained is from 60 to 100 lbs. according to the amount of material wanted in each bale.

"I Don't Care"

Many belt operatives express this sentiment when we show them their belts are improperly handled, unscientifically managed, and a cause of large money loss which is preventable.

We advocate Cling-Surface treatment and slack running belts and guarantee best results obtainable. Still, after explaining the benefits derivable from slack belts from A to Z, making valuable suggestions, and offering to take no money whatever for Cling-Surface if it doesn't do all we say, many men give little thought and often say, "I don't care. My belts give me a lot of trouble, that's true, but I haven't time to think of them."

The man who Does care uses Cling-Surface and it pays him well.

Every managing engineer who is keen as he should be in showing profits from his plant must give all the belting and transmission ropes systematic attention. And Cling-Surface treatment is the one

logical method of constantly maintaining high transmission efficiency and prolonging the life of the whole transmission system.

Where the initial tension is eased by Cling-Surface treatment, shafts, pulleys, hangers, bearings and their mountings are relieved of unnecessary strain, and there is a reduction in internal friction, of repair expense, lubricants and attention that make large annual savings—all due to the action of Cling-Surface.

Put Cling-Surface on just one tight belt for a trial. Select one that has been slipping badly, running off or wearing rapidly, and you will find Cling-Surface highly beneficial. Ask us for examples from plants where Cling-Surface has demonstrated itself to be indispensable. Let us quote f.o.b. Toronto.

Among the Functions of the Timber Factor

Are : To locate, examine, estimate, classify and appraise timbered areas ;

To assemble all necessary and useful information respecting kinds, quantities and qualities of timber and the topography of the land ;

To compile data showing costs and conditions under which operations must be conducted and to search out natural or possible markets.

This information should be prepared by those possessed of Knowledge Essential to Comparison.

We offer the timber buying and selling public the benefit of thirty-five years' connection with the timber trade of North, Central and South America, of accurate knowledge that cannot be gleaned from textbooks.

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

THESE HEADBLOCKS WILL WEAR

They are of new design, gotten up specially to withstand the jarring of heavy niggers, and they will stand the strain of the hardest work.

About twenty of them have been tested in mills all over the country since the beginning of the present sawing season, being thoroughly tried out.

The service they have given marks them as great headblocks well worth your while to investigate. May we send particulars?

BUILT FROM EXPERIENCE

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service and often in localities where repairs cannot be made without great inconvenience.

When you want a locomotive you cannot afford to overlook the experience of this company.

Experience in building large locomotives is invaluable in connection with the design of smaller ones in order to insure reliability which is the main question in logging work. You know what delays cost you.

McKINNON CHAIN CO., ST. CATHARINES, ONT.

STRONG GRIPPING POWER

One of the characteristic features of Dick's Belting is the strong gripping power, which ensures the transmission, positively without loss, of the whole power given off by the engine. The entire absence of stretching or slipping is another important quality Dick's Belts possess. It will pay you to investigate these belts before buying any other make.

Get a copy of Catalog No. 17.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |

QUEBEC & ST. MAURICE INDUSTRIAL COMPANY, Portland, Maine

Try pulling this Belt apart

That will give you some idea of the enormous strength built into Goodyear Belts. Not an ounce of untested rubber is used, not a roll of untested duck. Each finished Belt is inspected before shipping *to make sure* that it will stand the *wear* and keep *pliable*.

The Goodyear system of Belt making is calculated to give the greatest efficiency in practical Belt Service.

A close, clinging grip of the pulleys—absolutely non-slipping. Goodyear Rubber Belting gives this cohesive contact because of its yielding rubber surface, and the practical result is an immense saving of power.

Pliability under all conditions. A belt must be pliable to grip the pulleys. The hard cotton fibre of Goodyear Belting is permeated—under tremendous pressure—with rubber. The treated layers are compressed into an homogeneous mass. This preserves the pliability of rubber in the finished Belt.

Entire absence of "stretch." The "curing" or vulcanizing of Goodyear Belting is performed whilst the Belt is stretched to the limit of safety in a special machine. "Stretch" in service therefore is impossible. This means no stopping of machines for adjustment—no idle machines, no idle men.

Enormous strength. The union of carefully tested hard-fibre cotton with tenacious and elastic rubber "friction"—compressed to make the plies practically inseparable—gives a combination of prodigious strength. A Goodyear Rubber Belt is as nearly unbreakable as any Belt can be.

Long Life. The duck or fabric of Goodyear Belting cannot be reached by water, or anything else that would set up rot and destroy the Belt. A Goodyear Belt renders long and efficient service.

103

GOOD YEAR
Rubber Belting

Factory Superintendents specify Goodyear Belting. They are satisfied that Goodyear Rubber Belting puts the plant on a power-saving basis. Write for free Book on the choice of a belt.

SPARTAN LEATHER BELTING

possesses a unique combination of great pliability, wonderful tensile strength, high efficiency, and extraordinary durability.

A Belt For Hard Drives

Spartan is the result of sixty-two years belt building experience and a constant determination to make the highest grade belting leather possible to produce.

The Spartan is made from a special tannage of leather and is constructed especially for hard service—high speed drives with small pulleys—in fact for every hard drive in Saw and Planing Mills.

It is in Saw and Planing Mills where the maximum of power transmission is always demanded and that is where Spartan is absolutely without an equal.

In short there is no other belt like the Spartan nor will there be as long as there is a premium put on expert knowledge, on unlimited facilities and manufacturing experience.

We not only claim that Spartan Belting will outwear all other belting material (when used under the same conditions) but we guarantee it.

Look for the Spartan Trade Mark, it is your protection and guarantee of absolute satisfaction.

Send for copy of our latest catalog, prices and samples of the Spartan Brand.

The World-Famous
SIMONDS
 Crescent-Ground
**CROSS-CUT
 SAWS**

**MADE IN
 MONTREAL**

Yes they are famous because they have been giving such universal satisfaction to Lumbermen and Loggers for so many years and in so many different parts of the world. Crescent grinding and Simonds Steel is a combination that makes the best edge-holding, even tempered, well wearing cross-cut saw that the skill of man has yet been able to produce.

Price is not the factor; it is only results that count in making this the most economical saw on the market.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 33

Toronto, September 15, 1913

No. 18

The Fall Trade Outlook

It is difficult at present to give a definite idea of the lumber trade situation. There is so little definiteness about the situation in general that few will venture to talk plainly about the outlook for trade during the coming fall. The difficulty seems to be to understand present conditions. Reports vary widely. Some localities tell of extreme dullness, amounting almost to depression and others tell of encouraging activity. Early in the summer, after the real estate bubble had been pricked and the war situation had cleared a little there were signs of improvement. A few of the more active wholesalers began to tell of doing much more business than they had expected and some predicted that the dullness was over. It now looks as though these were a little too ready to take a favorable view of the situation. The regular summer's dullness settled in early and became more pronounced than usual, preventing the recovery which was expected during the early summer months.

A lumber trade journal is largely a reflection of the opinions of those who are engaged in the trade, and we might be expected under the above conditions to fall in line and publish something about the quietness of conditions. We probably would do so, were it not for one or two cheerful members of the trade upon whom we call periodically, especially when things are dull, who take the encouraging view of the situation more often than otherwise, and have seldom been known to err on the side of indiscretion. These men today are paying attention, not so much to the actual quietness in the lumber trade, as to general financial and commercial conditions, and they feel that, although we have experienced a period of unusual dullness, there are some reasons to feel confident about the immediate future.

Some of these reasons are to be found today on the financial pages of the daily newspapers. It is a few months ago only, since practically every stock which was speculated in on the exchanges was making

a new low record and the exchanges themselves were making low records in regard to the volume of business done. No one was inclined to buy anything of a speculative nature. Important large cities found great difficulty in borrowing money at reasonable rates. The owners of money, in fact, seemed for a time, to have disappeared. During the last three or four weeks an important change commenced to be apparent. The low prices of stocks made them attractive from both an investment and a speculative point of view. Money commenced to loosen up, and trade, following the lead, commenced to show a little more activity. Undoubtedly the favorable crop reports had much to do with this, while banks and governments assisted by encouraging the movement of capital and announcing the undertaking of large public works. However much one may wish to use these conditions as an argument that the coming fall will witness a strong revival, the most that one can safely say today is that a number of favorable signs are evident pointing toward continued trade activity.

A year ago, trade conditions in Canada were excellent and since then we have gone around the cycle of the months without any great let-up in the demand for money. Each fall, money becomes in great demand and a stringency develops which seldom passes until the new year is well under way. It is difficult to see how the conditions developing out of these factors can be any better this year than they were last. One most encouraging feature is the fact that the real estate boom is checked and will not withdraw such enormous quantities of money as it did a year ago.

Of all the provinces the most encouraging outlook is probably to be found in Ontario. During the first weeks of September and the last week of August, however, the province suffered from the annual disturbance of the Canadian National Exhibition. During these weeks actual trade came almost to a standstill as most of the travelers remained at home. On the other hand, a fair volume of enquiries is reported, indicating that the fall trade will soon open up. The farming districts of Ontario are practically certain to require large quantities of lumber this fall as they have had splendid crops. In the larger cities speculative building has been greatly reduced, but there are good indications of a large amount of building to meet immediate requirements. Throughout the province it is reported that practically none of the towns or villages have any empty houses.

The general feeling among the trade is that the next few weeks will give a fair indication of trade conditions for the fall and that there is enough enquiry already to indicate that improvement is coming.

U.S. Senate Removes Countervailing Woodpulp Duty

The most interesting event in connection with the pulp and paper industry of Canada which has taken place for many months is the announcement from Washington that the United States Senate has stricken out of the tariff measure the clause providing for a countervailing duty on wood pulp from Canada. The effect of this action will be to remove all retaliatory features of the United States tariff against Canada. This step amply justifies those in Canada to have held out for prohibition of the export of pulpwood in a raw state to the United States. Whether or not this prohibition is justified on its own grounds is another issue, and one upon which Canadians are not likely to differ very much. Its object is to provide employment for Canadians and to retain in Canada as much of the benefit as possible from its enormous resources in the form of raw material for the manufacture of pulp and paper. The making of pulp and paper in Canada is developing at a wonderful rate and it is safe to predict that with the countervailing duties removed upon the manufactured product entering the United States the growth of the industry will be so great in the near future as to make the developments of the last few years seem almost meagre.

There has been a great fight in the United States to prevent the carrying out of the proposal which has been embodied in the action of the Senate. Two chief parties have been engaged in the struggle—the news print paper manufacturers and the news print paper consumers. The former have sought to maintain the countervailing

duties upon Canadian products, so as to hold control of the market for paper in the United States. News print paper consumers have worked incessantly to bring about free entry for Canadian pulp and paper.

The Senate's action is an unqualified victory for them. Many side issues have been brought up during the progress of the campaign during the last two or three years to cloud the main issue and make it appear as though national dignity and honor were at stake. Fortunately these have not been permitted to carry much weight although at times they seemed to be playing an important part. Those who opposed the removal of the countervailing duty tried to make it appear that Canada had gone out of its way to offer an indignity to the people of the United States by refusing to let its pulpwood go across the border in the unmanufactured state. This view, however, has not been allowed to carry much weight, the same view being that Canada as the owner of large areas of pulpwood timber, had a perfect right, and even a duty, to see that they were so used as to bring the greatest benefit to the people of Canada. An effort was made for a time, in the United States, to make Canadians feel that they had been unwise in taking this step and to induce them to retrace it. But Canadians held firmly to their first position and have apparently been justified, as shown by the action of the United States Senate.

The true inwardness of the whole matter is well brought out in the report of the event as sent out from Washington. Senator Smoot

is reported as saying that he would vote for the amendment (to remove the retaliatory features), but as predicting also, that it would not be many years before the great pulp manufacturing business would be transported to Canada. "The only result," he said, "will be that the profits will go to Canadian manufacturers. I want to take this opportunity to congratulate Mr. John Norris, of the American Newspaper Publishers' Association, in the successful culmination of his long fight. He can go back to New York and report success."

Senator Hughes, in a statement upon the question also said "All the burdens on these retaliations must be borne by the American newspaper publishers, who, in 1912, paid indirectly, a penalty of more than \$2,000,000, in addition to the amount of retaliatory duties paid directly. This indirect tax was due to the uniform rates agreed upon and these artificial prices which the combination of the American papermakers has continuously maintained. No print paper can be bought in the open market. American mills will not sell print paper unless they know the destination of the paper, the purposes for which it is to be used, and the name of the buyer. They starve the market by restricting production, as is shown by their monthly reports to the bureau of corporations. They have kept down the stock of paper on hand at the mills to an eight days' supply for all the newspapers of the country. They have dumped paper into Great Britain at lower prices than they sell to the American consumer. The policy of retaliation against Canada fosters and helps that arrangement."

British Columbia's Pulp and Paper Industry

The pulp and paper industry of British Columbia is the subject of an interesting report recently prepared by United States Consul General David F. Wilbur, of Vancouver. The pulp and paper industry of the province is steadily growing, he writes, although the markets are as yet limited to the Pacific ports. With a production valued at \$1,250,000 in 1911 it is estimated that the 1912 production will amount in value to about \$3,250,000. That this industry requires an exceptionally large amount of capital is shown from the fact that already between \$12,000,000 and \$15,000,000 is invested by the five companies that have installed plants in the province, although only two are operating. There is a good demand for chemical pulp in China, Japan and the Pacific States, but practically no market for mechanical pulp. For the coarser grades of paper, such as wrapping and news, the markets are in western Canada and the western part of the United States, west of Spokane and Denver, the west coast of South America, Honolulu, Manila, Australia and New Zealand. Both in pulp and paper, the facilities for manufacturing are in excess of the market requirements. There is no question but that the best market for pulp will be the local mills.

One mill, located at Powell River, B.C., at present has a capacity of 150 tons of news print paper daily, and a recent addition to the plant will double its capacity in the near future. A local civil engineer in commenting on this industry in the province states that the cost of manufacturing a ton of news paper in eastern Canada is ap-

proximately \$7.50, and that the only items exceeding in cost those of the Eastern mills are labor and repairs, amounting to a difference of only a few dollars per ton of paper, which is more than offset by the low cost of wood. Another advantage the west has over the east is that logs can be towed to the mill at tidewater the year round.

The following figures are given in the report regarding the cost of manufacturing paper, pulp and fibre: It requires from 1 to 1½ cords of spruce wood to produce 1 ton of mechanical pulp, and about 60 to 80 horse-power for twenty-four hours to grind it, or nearly 100 horse-power per ton of output to drive all the machinery for the plant. Water power is the only feasible source. Steam is not required except for heating the buildings. To produce a ton of sulphite fibre requires from 1.75 to 2 cords of wood, about 250 pounds of sulphur, about 300 pounds of lime or limestone, and about 1 ton of coal or its equivalent in mill refuse.

To produce a ton of fibre with the soda process requires about 25 cords of wood, 250 to 300 pounds of 58 per cent. ammonia soda ash, from 700 to 800 pounds of lime, and about 2.5 tons of coal or its equivalent. The sulphite process is similar to that of the soda, the main difference being that salt cake or crude sulphite of soda is used. It requires approximately 1.5 cords of wood to produce 1 ton of news paper, and this wood, at the average cost of imported wood into the United States, would cost \$17 per ton of paper, as against about \$7.50 in Quebec, making a difference of \$9.50 per ton.

Railway Companies Fighting Their Fires

Steps which have been taken during the past year to put upon railway companies the full measure of their responsibility in connection with forest fires have unquestionably been of value in reducing the number of serious conflagrations which have taken place. According to the regulations now enforced by the Dominion Board of Railway Commissioners in this regard, the responsibility for forest fires along railway lines is placed upon the railway companies. Realizing the importance of this responsibility, the railway companies have taken much more active steps than formerly to prevent the occurrence of fires and to check fires which have been discovered along their lines. A definite indication of the importance attached to this matter by the railway companies is afforded by the case of the Grand Trunk. Following upon an order of the Railway Commission this railway company has issued instructions to its employees in regard to fighting fires and other railways are expected to follow suit.

The practical nature of the instructions issued by the Grand Trunk may be gathered from the following extracts:—

"Conductors, enginemen, and trainmen who discover or receive notice of the existence and location of fire burning upon or near the right of way or of a fire that threatens land adjacent to the right of way, shall report the same by wire to the Superintendent and any agent or person in charge of the first telegraph or telephone office. Advice of such fire shall also be given to the first trackman passed, by three short whistles repeated twice.

"It has been the duty of the superintendent to notify immediately, by wire, the nearest forest officer and the nearest section employees, of the existence and location of such fires.

"When fire is discovered presumably started by the railway, such sectionmen or other employees of the railway as are available shall, either independently or at the request of any authorized Forest Officer,

proceed to the fire immediately and take action to extinguish it; provided such sectionmen or other employees are not at the time engaged in labors immediately necessary to the safety of trains.

"If the fire is of such an extent that the section gang, or other local force available, cannot control it unaided, the Superintendent, or, in his absence, his representative, must immediately arrange for the despatch of the Supervisor of Track or other competent officer with the necessary additional men who can be drawn from those available in any department, and all necessary fire-fighting appliances, to the scene of the fire, and must so arrange the train service that they will get to the fire with the least possible delay, in order that no time may be lost in getting it under control."

Those who are not acquainted with the importance of this matter, or with the great difficulties presented by a forest fire, can scarcely realize the practical results which are likely to follow from these measures. A single instance, however, will bring the importance home in a convincing manner. In the year 1910 a certain United States Railway paid out \$100,605 in fire claims. In 1911 the amount was \$51,000, while in 1912 it had decreased to \$6,000. The explanation is simple. The company had improved the safety appliances upon its engines for the purpose of preventing the spreading of sparks and had enlisted its whole staff in the fighting of fires along the right of way.

The efforts of the governments of the various provinces of Canada to prevent the destruction of forests by fire are also meeting with encouraging success. The case of Ontario is briefly outlined in an announcement made by Mr. Aubrey White, Deputy Minister of Lands and Forests. Referring to the fires in northern Ontario which as-

sumed serious proportions during the third week of August, but which were fortunately extinguished by heavy rains, Mr. White said that the Ontario government now had 575 rangers on duty on Crown lands, railways, forest reserves, etc., while on licensed lands the licencees had about 300 rangers, making a total staff of nearly 900 men. The situation this summer had been quite serious on account of the extremely dry weather. Fortunately, however, the fires had been confined to the older settled parts of Ontario, such as Muskoka, Parry Sound, Haliburton, North Victoria, Peterboro and one or two other counties. These areas had been more or less cut over and there was a great deal of debris on the ground. Many settlers were located through these districts who used fire for clearing their lands and for other purposes. Some of them were careless and thoughtlessly started fires which caused much loss before they could be extinguished.

No forest fires of any serious character had occurred in Ontario reserves during the present summer and very little damage had been done in any district where government rangers were in charge.

The province of British Columbia has been fortunate during the present year in having few forest fires of any serious proportions. For a time it was feared that an extensive fire from Alberta had spread over the boundary and was destroying timber in the reserves, in the vicinity of Tete Jaune Cache. This fear, however, was without foundation.

According to figures compiled by the National Fire Protection Association, the timber destruction in British Columbia by fire during the year 1912 amounted only to \$300,000, whereas in 1908, when the restraining influences of education and organization had not yet become effective, the loss amounted to \$25,000,000.

Editorial Short Lengths For Busy Readers

The London Timber Trades Journal reports that many complaints are being made of the unsoundness of some of the White Sea shipments, the so-called first and second qualities especially being affected, some so badly that it is extremely difficult to find any percentage of really sound deals amongst them. It looks as though the sound portions of the logs have been cut into boards chiefly for the continental market and the centre portion cut to deals for the London market.

It is estimated that British Columbia contains over one hundred million acres of woodland, of which upwards of sixty-five million acres may be regarded as actually or potentially capable of producing merchantable timber, though, outside of this, the land is not of value. On this area Nature has been busy for a great many years storing up what is today one of the greatest of the few extensive reserves of commercial timber left in the world. It is estimated that this area contains over three hundred billion feet board measure of timber, comprising over half the standing timber of Canada.

The enquiry regarding ocean freight rates between Canada and Great Britain which has been mentioned already in these columns is already under way in London, Eng. Mr. H. L. Drayton, chairman of the Dominion Board of Railway Commissioners, visited London as the representative of the Dominion Government, with a view to discussing the question of control, with the officials of the Colonial Office and the Board of Trade. Mr. Drayton, as chairman of the Dominion Board of Railway Commissioners, is closely in touch with the views of Canadian lumbermen upon this important question.

A substantial increase in sales of timber from United States national forests in Washington, Oregon and Alaska, has been made during the past fiscal year, according to figures given out by the United States forest service. With the close of the twelvemonth ending June 30, 1913, the reported amount of government timber cut in the states quoted aggregates 115,046,000 feet. The number of new sales is 673. The amount of timber actually sold reaches a total of 483,828,000 feet board measure. These figures show an increase over the previous year of 3,529,000 feet in amount of timber cut. The

number of new sales in the fiscal year of 1912 was 656, as against 673 last year, while the amount of timber sold is greater by 282,980,000 feet. In addition to timber sales proper, 3,403 permits were issued to settlers and farmers for the free use of national forest timber for domestic use. This use took 14,756,000 board feet.

The average stumpage price was \$1.82 per thousand board feet, an increase of 16 cents per thousand over prices received in 1912. A feature of the timber sale business in the states reported on is the large proportion of small sales made. These were sales to men of small capital to supply the needs of people living in or near the national forests and to furnish business opportunities to the small operator, in pursuance of the avowed policy of the forest service to provide first for local demand before selling timber for transportation to distant markets. Only 11 of the 673 sales covered by the report were for more than \$5,000 worth of timber, while 92 per cent. of the total number consisted of sales involving less than \$100.

Until quite recently it has been impossible to ship mouldings from British Columbia to eastern Canada on account of the high classification insisted upon by the railway companies. On July 21st a new tariff supplement was issued by the railways, quoting mouldings at the same rate as shingles, to all eastern points. This supplement became effective on August 15th and gives for mouldings a rate of ten cents a hundred pounds over the regular lumber rate, making 75 cents a hundred pounds to western Ontario points. British Columbia manufacturers are already showing an interest in the situation created by this alteration in the freight tariff. The Canadian Western Lumber Company, who manufacture an excellent line of mouldings, base casings, etc., from British Columbia fir have furnished their eastern representative at Toronto with some extremely attractive samples. They are looking forward confidently to opening up an extensive trade in these products.

A recent Washington, D.C., despatch says that wood pulp and paper, destined for the United States, but transhipped at some intermediary point, will be admitted free of duty from all European countries having "favored nation" treaties with the United States.

Canadian Operations in the South

Wilson Lumber Company's Hardwood Plant at Valley Park, Miss.—A Few Interesting Illustrations of the Work

Inspecting Lumber at a "Slip."

Grading out Stocks for Stacking.

The accompanying interesting series of illustrations give an excellent idea of a few of the important features of the production of hardwood lumber at a typical mill in the Southern States. These illustrations were secured at the mill of the Wilson Lumber Company, Limited, Toronto, which is located at Valley Park, Miss. The illustration of a red oak log on its way from the yard to the mill is interesting in more ways than one. In the first place it gives an idea of the excellent quality of timber which this company is putting through its mill. In the second place it is of special interest because of the method in which the log is being drawn. The power, as will be seen, is furnished by a number of mules, a variety of power which seems rather strange to Canadian operators. We are informed however, that the company gets very good service out of these animals.

Another of the illustrations shows an excellent specimen of Spanish oak being rolled off a waggon into the mill yard. In this illustration it will again be noticed that the Wilson Lumber Company are obtaining a splendid line of raw material for the production of their hardwood lumber.

A genuine American white ash log is shown in one of the illustrations. A fair idea of the size of this log may be obtained from comparing it with the height of the inspector standing upon it. A

American White Ash Log.

Part of Its Product.

Spanish Oak Log Arriving at the Mill.

A Fine Red Oak Log—Mule Power Logging.

All That Was Left After the Floods.

companion picture shows the same piece of ash cut up for car work. This stock for car work is cut in special widths and thicknesses.

In one of the illustrations, a portion of the yard of the Wilson Lumber Company, at Valley Park, Miss., is shown, where the lumber is put up on sticks for drying. Unfortunately, this illustration does not show any of the lumber actually on the sticks as it is only being graded out, preparatory to stacking. The illustration also indicates the method in which the lumber is moved from the mill to the mill yard, via the tramway which is shown in the illustration.

Another of the illustrations shows a "slip." This is where the lumber comes from the saw after the edges have been trimmed. At this point lumber is inspected before the stock is taken to the main yard for stacking.

An illustration which shows a number of piles of lumber in the yard is of particular interest to Canadians, inasmuch as it gives an idea of the difficulties caused by the serious floods on the Mississippi River. This picture was taken after the yard had been swept by two floods. When the waters had receded, a few of the piles of lumber were left in their original places, as shown in the illustration, others had apparently vanished. A large portion of the lumber was swept into the bush which is seen in the background. This was gathered up afterwards and re-piled, quite an expensive operation.

American Forest Trees

One of the most interesting and valuable publications which it has been our good fortune to receive is Mr. Henry H. Gibson's recently published book, entitled "American Forest Trees." The material on which this volume is based, appeared in the Hardwood Record, Chicago, in a series of articles beginning in 1905 and ending in 1913, and descriptive of the forest trees of North America. This series of articles attracted much attention among the readers of the Hardwood Record. The collection of these articles in the form of a book will be greeted by all who are interested in the subject with much approval. More than one hundred leading species of trees are included in the series. These constitute the principal sources of lumber for North America. The volume includes all the species described in the series of articles, together with a large number of less important trees. Every region of the country is represented; no valuable tree is omitted and the lists and descriptions are as complete as they can be made in the limited space of a single volume. The work is practical, simple, plain and to the point. Numbers of photographs and drawings of trunks and foliage are reproduced in illustrations, giving an excellent conception of the various trees under discussion.

A cursory glance at this interesting book will convince any one that it is a valuable contribution to tree knowledge, both in its illustrations and in its descriptions. The various articles composing the book have been so interestingly written that many a reader who intends only to consult the book will find himself making a study of it in detail. The articles have been edited by H. Maxwell. The book is attractively printed on a high class of paper and solidly bound in cloth with leather back and corners. An excellent index enables one to locate any particular species of tree regarding which he desires information.

Lumber Matters in the Law Courts

Privy Council Decides Two Important Cases Involving Ownership of Logs and Payment for Company Shares

Ownership of Logs Under Mortgage: The Judicial Committee of the Privy Council have delivered judgment in the appeal of the Imperial Paper Mills of Canada, Limited and another, vs. the Quebec Bank and others. The matter involved was the ownership of a quantity of logs which were in the river on their way to the mills when the company was declared insolvent. The Quebec Bank claimed the ownership of these logs under certain securities held by them. Mr. Clarkson, liquidator, representing the company and the mortgage-bond owners claimed that the bank securities were unavailing to prejudice the rights under the mortgages. These rights, they claimed, covered the logs in question which were "on their way to the mills" on the date of the mortgage and therefore, were not excepted from the assets covered by the mortgages. The Judicial Committee held that the appeal of the company should be dismissed with costs.

Payment for Company Shares:—The Judicial Committee of the Privy Council have given judgment in the case of Cameron vs Cuddy and another, an appeal from a judgment of the Supreme Court of Canada on October 7th, 1912, which in itself was an approval of the decisions of the Court of Appeal for British Columbia and of Mr. Justice Morrison. The question involved related to payment for shares in a certain lumber company, regarding which an agreement had been drawn up providing for arbitration in case it should be found that any deficiency existed which would warrant a deduction from the payment made in purchasing shares. Arbitration had been found necessary on account of a deficiency, but while being held it broke down on account of some irregularity of procedure and nothing further was done regarding it. An order had already been made that the appellant should pay the full sum without deduction. It thus developed that he stood under order to make payment, although all parties admitted that a deficiency existed. It was not the appellant's fault that the amount of deduction could not be ascertained. The Judicial Committee found that he should not be required to make payment in respect of assets which, it was admitted, he had not received. Accordingly they reversed the judgment of the Canadian courts, with costs, and recommended that the trial should proceed for determining the amount of deficiency.

A Good Word for the Railway Company

Many complaints are made by lumber shippers in Canada regarding the failure of the railway companies to provide prompt shipment of their stocks. It is a unique pleasure therefore, to publish something of a different nature, which is contained in a recent letter to the Canada Lumberman, written by John T. James, Bridgeburg, Ont. Under date of August 29th Mr. James says:—"I want to give you an item of interest to shippers, which should be published in justice to the Grand Trunk Railway. On April 14th last we started sawing hemlock at Whitehall. We loaded three cars straight from the saw, the first car reached Ridgeway on Saturday of the same week. The others followed on Monday and Tuesday following. On August 7th we billed out a car of spruce from Whitehall and on Saturday, August 9th it was at Ridgeway, three other cars following in similar time, as they were loaded and billed out. This may not be quite a new record, but it is certainly good time—all Grand Trunk Railway route."

We take pleasure in publishing the above in justice to the railway company. By way of indicating whether these cars are exceptional, we would be pleased to hear from other readers of the Canada Lumberman regarding their own experiences.

Canadian Exhibit Leads the Way

A great deal of interest has been created in the United States in connection with the proposed forest products exposition. It has been suggested that one of the exhibits shall be a model saw mill in operation, showing the manufacture of lumber from the log to the finished product. A United States lumber trade journal, discussing this suggestion says that the value of such an exhibit would be inestimable and the sponsors of the American exhibit can be more or less assured of the success of efforts in this direction by the success with which a similar effort has been attended in Canada. A description is then given of the miniature saw mill exhibit at the Calgary fair, by the Crown Lumber Company, which has already been described in these columns. The journal above mentioned then states that this exhibit has created unlimited interest among those attending the fair and concludes that if this is the case in a community in which it is no novelty to see the actual operation of a sawmill, it should even be more interesting in a community such as Chicago where not one citizen in a thousand knows what a modern sawmill looks like.

Lumber and Its Interests at the C. N. E.

Machinery, Equipment, Supplies and Products Displayed—A Wide Variety of Exhibits of Instructive and Educational Value

At the Canadian National Exhibition held at Toronto this year there were, as usual, a large number of exhibits of special interest to lumbermen. On account of their varying nature they were scattered about the different buildings, but as a rule their location was prominent enough to make it easy for lumbermen to find them. Among the chief exhibits were the following:—

The Shouperior Manifold, shown by C. H. & B. J. Myers, 29 Colborne Street, Toronto attracted a great deal of interest. One of the great difficulties the retail lumberman with his multitude of small accounts has had to contend with in the past has been office system in reference to his deliveries and billing system. The "Shouperior" manifold manufactured by the Autographic Register Company of Canada, Limited, of Montreal, has eliminated this difficulty to a great extent, and is especially adaptable to the retail lumber business. The register issues three or four full and complete records of every sale with one writing each of which is printed separately and numbered consecutively alike. The order is written on the manifold—the office retains the invoice and charge copy and sends the last or driver's copy to the shipper who prepares the goods and makes delivery—sending along with the driver the delivery ticket to be signed by the recipient of the goods as an acknowledgement of receipt. The driver brings back this copy and turns it into the office where it is compared with the invoice in the charge copy. The invoice is then mailed to the customer—the account charged from the office copy and the sales analysis is taken. The office copy is then filed alphabetically while the delivery ticket is filed numerically. Thus it will be seen that at one writing the "Shouperior" manifold eliminates the order book, driver's book and day book as well as providing the invoice for the customer. On account of the stationery being printed in rolls to fit the machine a saving of about 30 per cent. is made on this important item. A very fine exhibit of these manifolds was to be found at the Canadian National Exhibition under the direction of Messrs. C. H. & B. J. Myers, 29 Colborne Street, the Toronto representatives.

Messrs. W. A. Martin & Company, who have recently moved into new premises at 70 Lombard Street, Toronto, exhibited a full line of belting and tool steel. They were showing the Graton & Knight Manufacturing Company's belting, specializing particularly on waterproof leather belting. They also showed A. B. C. fool proof steel manufactured by Messrs. Darwin & Milner, of Sheffield, Eng. Their "Gripoly" belting came in for very favorable notice. This is a solid woven hair belt reinforced with leather edge. The manufacturer claims that it has four times the strength of double leather belting and is less expensive. "Gripoly" is fast finding favor among the lumbering trade where its pulley gripping qualities, its immunity from damage by heat or cold, dampness or dust make it especially valuable. Mr. W. R. Green who was in charge of the exhibit is sales manager for the company.

Crescent Belt Fasteners—An exhibit of special interest to the lumbering trade was that of the Crescent Belt Fastener Company. The "Crescent" fastener is being used with great success throughout the country and is proving very popular. While it is widely known in the American and English markets it is practically new to the Canadian trade. By the use of patented metallic plates and self-piercing rivets, no holes are cut in the belt, the fibre or warp being merely separated, so that instead of removing material as in the punching of holes for leather wire or steel lacing or for bolts or locks which weaken the belt, the Crescent method actually reinforces at the joint, and the strain is equally distributed across the entire width, thus maintaining a uniform grip at all times. The head factory of the company is in New York, but the Canadian branch is in the Carlaw Building, with Mr. H. J. Walker as Canadian manager.

The "Positive" line of Transmission machinery was well represented by the manufacturers, The Positive Clutch & Pulley Works, Limited, in their exhibit in the Machinery Building. In operation were to be found their all-wood split pulley, together with their combination pulley and the multiple disc gas engine clutch, both of which lines are winning favor every day with the lumber trade. A feature of the exhibit also was an automatic fire-hose reel. With this, all the water can be turned on instantly without removing any of the hose, getting a full stream on the fire immediately while uncoiling hose. That the company are giving the trade what they require in transmission machinery is evidenced by the continued and steady expansion of work in their modern factory at Aurora, Ont. The head offices are 11-15 Jarvis Street, Toronto.

Mahaffy Trucks—Trucks to-day have entered into modern business as an important labor-saving machine—a reducer in the cost of production. The lumber yard, planing mill and woodworking plant have come to look on them as a necessity. A good exhibit of different styles of trucks was shown this year by W. S. Mahaffy, 10-16 Plymouth Ave., Toronto, who manufactures warehouse and factory trucks for all purposes. One of the special trucks shown was built on the tilting principle, the centre wheels being higher than the end wheels, with loose posts. The end wheels travel on a steel axle giving full liberty for turning corners, a principle that has many advantages over the swivel wheel and which has been thoroughly tried and proven for a great number of years by European manufacturers.

Beal Bros., Limited, Toronto, tanners and manufacturers, showed a splendid line of their "Round Knife Brand" harness, horse collars, blankets, rugs, etc., which are especially suitable for lumbering operations. One of the features of their exhibit was their display of oil ran moccasins and sporting boots. Large quantities of these moccasins have been sold during the past season throughout the lumber camps. With their new tannery at Uxbridge now in a position to take care of all orders, this enterprising firm are anticipating a large increase in business during the coming winter. Mr. W. A. Beal was in charge of the exhibit, assisted by his eastern and western Ontario representatives.

The Dearborn Chemical Company of Canada, Limited, Toronto, gave demonstrations in their exhibit in Machinery Hall of their treatments of boiler feed-waters which were of great interest to saw mill men. The Dearborn methods consist of making a thorough and careful analysis of the feed-water, thereby ascertaining the kinds of substances which it contains and the quantity of each, a thorough consideration by their engineering department of conditions existing in the plant and finally the construction of a formula for treatment. The company have just completed a large and modern factory and have general offices in the Traders Bank Building, Toronto.

A. R. Clarke & Company, Limited, Toronto, exhibited a full line of their "ARC" brand of mitts, gloves, coats, shirts, pants, moccasins, larrigans and wannigans, in the Manufacturers Building; also samples of the leather from which these different products are made and which is all tanned by the company. A large addition is now being made to their factory on Eastern Ave., necessitated by the rapid growth of their business throughout the country.

The Millers Supply Company, 331 King Street West, showed a fine line of leather belting manufactured by Fleming, Birkby & Goodall, Limited, of Halifax, Eng. They have recently taken the agency for this English oak-tanned leather belting, which has made a name for itself throughout both continents. Mr. Crawford of the Millers Supply Company was in charge of the exhibit.

The Cling Surface Company of Buffalo, N.Y., demonstrated their Cling Surface to splendid advantage in Machinery Hall under the direction of their Mr. J. B. Faatz. Belt users are realizing that by using the Cling Surface treatment they invariably save money. The result has been that the company enjoys a large and fast growing clientele throughout the country.

Cowan & Company of Galt, had an exhibit of great interest to woodworkers, in Machinery Hall. This comprised their new 12-inch moulder recently placed on the market, a two-chain saw, mortiser, hollow chisel mortiser, power-feed rip saw, variety saw and automatic knife grinder with water. Mr. Wm. Cowan was in charge of the exhibit.

The Wm. Hamilton Company, Limited, of Peterborough, Ont., exhibited a full line of their principal manufactures in the Machinery Hall. Their contractor's centrifugal pumps, Samson water turbines and saw mill machinery were displayed to good advantage. The whole exhibit was in charge of Mr. R. C. Cameron, the sales manager.

The Preston Woodworking Machinery Company exhibited for the first year in Machinery Hall and demonstrated their different lines to good advantage under the direction of Mr. A. M. Kerr. Their 36-inch band saw with its all steel wheels was one of the features of the exhibit. They also showed a power-feed rip saw, a variety saw and a pony planer.

The Tallman Brass & Metal Company, Hamilton, Ont., had a large and interesting exhibit in the Industrial Building. This company are now making the Tallman carburetor for gasoline engines. The other chief lines which attracted the lumber trade were: Special "Arctic" babbitt for sawmill and lumber machinery, manganese bronze casting, and 3X genuine "Arctic" metal for heavy machinery.

The Dominion Belting Company, Limited, Hamilton, whose exhibit was in the Machinery Hall, displayed their "Maple Leaf Belting." Some of their special sizes were 5 ft. 10-ply and 52-inch 20-ply. Maple Leaf Belting is finding great favor with the lumber trade throughout the country and during the past season the factory at Hamilton has been running to full capacity to keep up with the orders.

The Shurly-Dietrich Company, Galt, Ont., had, as usual, a very large exhibit of their saws and tools in the Industrial Building. Their plan of exhibiting is a very attractive one, the wall space being artistically covered with saws of all descriptions. The Shurly-Dietrich Company claim to be the largest saw manufacturers in the British Empire and their goods are all Canadian made.

The Home Rubber Company of Trenton, N.J., manufacturers of high-grade mechanical rubber goods and packings, had an interesting exhibit of their well-known N. B. O. packing, in Machinery Hall. Mr. C. H. Swoger of the head office was in charge. Their Canadian representatives are Wm. C. Wilson & Company of Toronto.

The Canada Machinery Corporation, Limited, had their exhibit in Machinery Hall. Among the many well-known lines which they showed were their new 15-inch inside moulder, a new heavy pattern tenoner with their standard chain mortiser. Mr. A. M. McGill of the head office, Galt, was in charge of the exhibit.

The Carborundum Company, Niagara Falls, N.Y., exhibited in the Industrial Building. Of special interest are their "Aloxite" goods. These include "Aloxite" saw gummers and "Aloxite" cloth for machinists. Among the large range they were showing were saw wheels, garnet paper for woodworking, etc.

The Garlock Packing Company, Limited, of Hamilton, exhibited a full line of their packings and mill supplies in Machinery Hall. Mr. H. G. Fletcher of the Toronto office was in charge and was kept busy attending to the many enquiries for this well-known line of goods.

The Canada Metal Company, Limited, Toronto, exhibited a large line of their products in the Machinery Hall. Their motto is "Everything in Metals." Their exhibit was both comprehensive and attractive.

Batts, Limited, Toronto, had a splendid exhibit of doors, columns and interior finish in the Industrial Building, as well as a separate exhibit on the grounds near Machinery Hall, which specialized on greenhouse construction.

J. J. Turner & Sons, of Peterborough, Ont., manufacturers of tents, awnings and lumbermen's supplies, exhibited an up-to-date contractor's tent which attracted much attention.

Why Ocean Freights Are High

Many reasons have been given the advance in freights on ocean going vessels for the handling of lumber, during the last year. Whatever the cause may be, it is unquestionable that the cost of shipping lumber and timber by ocean vessels has been very high throughout the past year. For a few brief periods there has been promise of a drop in freight rates, but they have not been really effective or general. A most interesting cause was mentioned to the Canada Lumberman during a visit recently paid to a large firm of lumber manufacturers. This company had been in touch with Pacific Coast shipping companies with a view to obtaining vessels for shipments to the Atlantic Coast either by way of the Horn or by railway across the Isthmus. Extensive enquiries resulted in the information that vessel owners were asking 105 shillings per thousand feet. Inasmuch as this is considerably above the cost of shipment by rail across the continent, no business resulted.

The explanation of the high rate asked by the vessel owners was given that the United States government had obtained options upon a large number of vessels for carrying coal which was to be transported from the Atlantic to the Pacific Coast. The general presumption was that this was a precautionary measure in case of hostilities breaking out between the United States and Mexico. It was also reported that the government had recently decided to exercise these options, which were said to cover practically all available tonnage. An idea of the excessive cost of shipment by vessels to-day is afforded by the fact that vessel owners who are now asking the rates above quoted were asking three or four years ago, only 65s.

Production of timber for the three months ending June 30th was the largest on record in British Columbia. It amounted to 240,000,000 feet, as compared with 218,000,000 feet for the same period of last year.

The National Hardwood Lumber Association, general offices 1864 McCormick Building, Chicago, Ill., have issued a revised copy of the Inspection Rules in use by the Association. All members of the Association have been furnished with copies. The trade will be supplied promptly on application to the secretary's office.

The Late Leonidas Villeneuve

The Late Leonidas Villeneuve

By the death of Mr. Leonidas Villeneuve, president of L. Villeneuve & Co., Ltd., 2599 St. Lawrence Boulevard, Montreal, at the age of 64, the city of Montreal has lost one of its oldest wholesale and retail lumbermen. For over 40 years he was in the lumber trade, going from his birthplace, St. Annes des Plaines, Terrebonne County, P.Q., to Montreal, where he established a small business in the north end of the city. As the district developed the trade extended, Mr. Villeneuve remaining in the same locality during his entire business career. He was during the later years one of the largest dealers in lumber in the city.

Five years ago Mr. Villeneuve established the Eagle Lumber Company, St. James street, Montreal, wholesale lumber dealers, and was elected president. The company now does a very large trade.

Mr. Villeneuve took a deep interest in local affairs, especially in civic improvements, and it was chiefly due to his energy that the district became one of the best suburbs in the city. Prior to the municipality being taken over by Montreal, he was three times mayor of Ville St. Louis. He was also an active politician on the Conservative side, but declined to become a candidate either for the federal or provincial parliaments.

Death was due to heart disease after a few days' illness. Mr. Villeneuve leaves a widow and one son, Arthur. The latter will carry on the business.

Laurentide Company Making Good Progress

Montreal, Sept. 3.—The profits of the Laurentide Company, Limited, Grand'Mere, P.Q., for the year ended June 30, were \$758,085, a gain of \$4,513 on the previous twelve months. In addition to \$128,700.85, taken from the earnings for betterment of plant, there was expended during the year on capital account for the new power development, \$471,728.22; for the enlargement of the sulphite mill, \$62,735.69; for the extension of the ground-wood mill, \$112,162.98; for the extension of the steam plant, \$71,379.17; for additional timber lands, \$160,912; and for real estate at Grand'Mere, \$53,179.35. It was stated by Mr. George Cahoon, the vice-president, at the annual meeting, that the explosion at the sulphite plant disorganized that branch of the business for at least six weeks, during which time, not only did they lose the profit on the sale of sulphite, but they had to purchase the company's requirements from outside, paying very high prices. Mr. Cahoon also referred to the work being done by the Provincial Government in building the storage dam in the St. Maurice district, which work, it was hoped, would be completed during the winter of 1914-15, and would be of great benefit to the company. The company had co-operated with the owners of other limits in protecting the forests in the St. Maurice district. Notwithstanding the large number of paper companies that had come into existence during the past year, the Laurentide output had not been, excepting the news print department, appreciably affected. The Laurentide's diversity of product, and their market all over the world, made their business a steady one.

Quebec Cullers Report

The following comparative statement of timber, measured and culled to date, is furnished by the Supervisor of Cullers, Quebec, P.Q., under date of September 4th:—

	Cubic Feet 1911	Cubic Feet 1912	Cubic Feet 1913
Waney white pine	707,920	830,280	216,600
White pine	9,120	1,400	7,560
Red pine	27,720	1,400	960
Oak	57,040	73,520	115,840
Elm	221,680	275,280	211,520
Ash	120	480	1,000
Birch and maple	58,800	38,640	47,680

Quebec's Receipts From Lands and Forests

According to the financial statement of the Province of Quebec for the fiscal year ending June 30, the receipts for lands and forests totalled \$1,760,466, this being the most productive of any department. The expenditure of the department was \$327,383.

THE WOODWORKER

The Filer Who Usually Isn't Out of a Job

This thing of wearing band saws, without a fracture, to a narrowness that renders further use impracticable, has more sides to it than one. It is really very nice when one looks at the saw expense alone; but is it a paying proposition when the output of lumber is considered? In a great many cases—in the majority of cases, I may safely say—it is not. The question is: Has the saw cut as much lumber during each hour of its work as it should have cut? It is a far greater question than the matter of the saw expense.

When I was a good many years younger than I am at the present day I strove for immunity from fracture in my bands more than for any other thing. I was fitting saws for a 6-ft. mill, and having a sort of steady, dragging success. My employer came into the filing room one day and brought along a visiting filer, a man with a far-reaching reputation, to see me. Now, this employer of mine had a mortal dread of cracking, just as I had; he pointed to me with pride—a thing that was not lost to my notice—and said to the visiting filer:

"This young fellow rarely or never has a fracture in his saws. Remarkable, isn't it, for a man of so little experience?"

"Yes, quite so," returned the man at his side; but, in spite of him, there was a slight note of insincerity in his voice. "I can't say that much for myself," he added.

Later in the day that big filer came alone to me, and gave me an invitation that was almost a command to come to his mill the first time I found a day of leisure. I was mighty glad, believe me, to promise him that I would go. And I had a sneaking notion somewhere in a corner of my benighted brainbox—a notion that he wanted to find out from me just how I managed to get along without cracks in my saws. I was, actually, that big a fool. So I went to pay the big filer a visit at the very first opportunity.

It was a large mill and a fast one—in fact, it was the largest and the fastest I had seen up to that time—two 12-in. bands running under the same roof. When I had reached the second floor, I stood and watched in wonderment. The saws were ripping boards off so rapidly that the ends almost touched on the live rolls. After a number of years the manner in which those saws slashed off still seems wonderful to me, so great and lasting was the impression I had.

But I whispered to myself: "Quantity, and not quality, is what they want here. They don't care anything about quality."

I stepped to a point from which I could see better. The saw I was watching was cutting as straight as a line, with never a bullhead or a dodge, even for a big knot. It wasn't altogether quantity, after all, that they wanted there. They wanted both quantity and quality, and they got it.

When I walked into the filing room, which was in the third storey of the mill building, I was beginning to feel that I was a very small pumpkin indeed, for I realized that my saws, even allowing for their littleness and thinness, were not working nearly so well as those I had just seen running.

The big filer and his helper were as busy as bees in a hive. They were in the act of applying a pair of red-hot irons to a pair of laps on a saw that was almost full width. That was a thing that I very rarely did—brazing. My brazing clamp was covered with dust, the dust of months of idleness.

I walked over to where the filer and his helper were screwing down the hot irons. The filer smiled his cordial smile, and spoke. He said he would soon be ready to talk with me. I waited, I confess, with a great deal of impatience.

When the joint had been taken from the clamp, the filer sent his helper to the round-saw bench, and himself went to a saw in one of the grinders, with me following. As he swaged that saw he talked with me. I am going to quote a part of our conversation verbatim:

"You have noticed, I take it," he began, "that I have some cracks."

I nodded. I had already found three fractures. "What causes them?" I asked—and mentally prepared to furnish information.

The answer came readily and quickly: "Strain." He went on, speaking with that calm assurance of the man who knows: "Strain, and only strain. And so you"—he looked around at me without taking his hands from his work—"you don't have 'em?"

"Perhaps one or two in the run of a year," I said, proudly.

"And your mill makes an average of 18,000-ft. per day of ten hours," pursued the big filer. He knew it—my employer had told him. "Now, if your mill could make an average of 22,000-ft. instead

of 18,000, how much more lumber would it put out in the run of a year?"

"Counting 300 working days to a year," I figured, speaking aloud, "it would cut 1,200,000-ft. more."

"Right," agreed the big filer, his hands still busy with the swage. "Let's say that the cost of sawing is \$2 per 1,000-ft., which is a rather low estimate. Your employer lost \$2,400 last year because your saws didn't average 22,000-ft. per day. If you will tension your saws as highly as they may be tensioned and still have them so that they will permit of leveling, and at the same time run the tension out pretty close to the edges, your mill will easily make an average of 22,000-ft. The saws, however," and here he looked at me with a twinkle in his eyes, "are apt to crack a bit now and then, owing to their being strained to such a high degree on the edges."

"But even if they did crack occasionally," I muttered, seeing light, "the \$2,400 per year would more than offset the expense. Say, for instance," I continued, "that we use six more saws per year than we've been using; six saws would cost a little more than \$400—"

He slapped me on the back so hard that for a brief moment I was sure he meant to knock me down.

"Now, my young friend," he exclaimed heartily, "you're on!"

"And much obliged to you," I said gratefully.

Yes, I was really "on." The big filer was in the right. The saw expense is not the biggest expense in the manufacture of lumber. It has its place, of course, but it is a small place when compared to the output. The output—that is the vital thing; it is the thing that makes or breaks the firm.

I will here admit that it is better to have no fractures in one's saws, if one can get all there is in the saws without it. But, unfortunately, in this mundane sphere, where all is imperfection, one may not go so near to the breaking point without now and then slipping up in his calculations.

The big filer I mentioned in the foregoing, I found, was only one of many big filers who tolerated an occasional fracture. In the finest and most successful mills that it has been my good fortune to visit I found the knights of the file and hammer using the slogan, "If they have to crack now and then to do what I want them to do, let them crack."

Of course, to carry the idea too far would be—well, it would be carrying the idea too far. But one needn't go to the extreme in the matter. Sound judgment, like the prayers of the righteous, availeth much.

When the low-tension filer decides to increase his tension, he should be careful and go slowly. The high-tension saw must be watched faithfully, and it must be doctored as soon as it needs doctoring. More work is required here, too, on account of the narrow front tire being prone to pull out rapidly from the strain brought to bear upon it. Yes, they are more trouble to keep up; but the filer who can do it successfully isn't usually out of a job. The old saying that "The woods are full of filers" won't hold water in every case. The "woods" are never full of filers.

More cracking naturally brings on more brazing. Many brazes in a saw are apt to make the lumber somewhat rough—unless the filer knows how to prevent it. For my part, I cut off the soft tooth entirely, and I am always careful to see that the teeth immediately above and those below the joint have a little less swage than the others. This may leave a very slight ridge on the lumber, but a ridge is easily and wholly removed by the surfacer, and is really of no importance.

And the brazed portion should, by all means, be of the exact thickness of the rest of the plate. Sufficient attention is rarely given to this point in fitting band saws. Calipers serve a good purpose here—calipers, the best of care in leveling, and a good surface file. Thick brazes pound badly in the guides, crystallize and break at an early stage. Thin brazes are just as bad to break, and for a reason too obvious to need explanation.—H. C. T., in *The Wood-Worker*, Indianapolis.

Value In Woodworking Machinery

It has been the experience of the writer to come in contact with owners or managers of concerns in the furniture and planing mill industries, whose first question concerning a new piece of machinery is, "How much does it cost?" They are greatly concerned with initial cost, and, with investigating the merits of the machine in question,

will almost invariably refuse to consider it after they have once heard the price.

It is not so much what a machine costs that should determine its value, but what it can do. Whether planer, surfacer, molder or tenoner, the durability of the machine and its freedom from repairs should be considered above all else. The cost price is a minor detail.

It is natural enough for men in business these days to be lured away from common sense by lower cost. When they see a machine which purports to do just as good work as another, and for half the cost, the dollar mark seems to take precedence.

The woodworking man, however, who is versed in mechanics, by thoroughly examining a machine, can tell whether or not it will turn out a good quality of work in sufficient quantities to warrant the expenditure of the required money for its installation. Nine times out of ten he will not sacrifice the efficiency of his establishment in the slightest degree by the "penny-wise and pound-foolish" idea.
